

# INSURANCE VERSUS MORAL HAZARD IN INCOME-CONTINGENT STUDENT LOAN REPAYMENT

Tim de Silva  
MIT Sloan

May 2024

Disclaimer: The results of these studies are based, in part, on Australian Business Registrar (ABR) data supplied by the Registrar to the ABS under A New Tax System (Australian Business Number) Act 1999 and tax data supplied by the ATO to the ABS under the Taxation Administration Act 1953. These require that such data is only used for the purpose of carrying out functions of the ABS. No individual information collected under the Census and Statistics Act 1905 is provided back to the Registrar or ATO for administrative or regulatory purposes. Any discussion of data limitations or weaknesses is in the context of using the data for statistical purposes, and is not related to the ability of the data to support the ABR or ATO's core operational requirements. Legislative requirements to ensure privacy and secrecy of these data have been followed. Source data are de-identified and so data about specific individuals or firms has not been viewed in conducting this analysis. In accordance with the Census and Statistics Act 1905, results have been treated where necessary to ensure that they are not likely to enable identification of a particular person or organisation.

## GOVERNMENT-FINANCED HIGHER EDUCATION

- Governments often provide subsidized financing for higher education
  - Student loans = \$1.6 trillion in US and 10% of household debt in US and UK

# GOVERNMENT-FINANCED HIGHER EDUCATION

**This Paper:** Insurance vs. Moral Hazard

Conditional on ex-ante choices, how does income-contingent repayment affect **labor supply** and welfare?

- ① **Setting:** Australian government's income-contingent student loan program
  - **Variation:** discontinuities in repayment rates + policy change to these rates
  - **Identification:** limited room for selection and ex-ante responses
- ② **Research design:** bunching at discontinuities before and after policy change
  - **Data:** universe of income tax returns + student debt balances

Conditional on ex-ante choices, how does income-contingent repayment affect labor supply and **welfare**?

- ① Setting: Australian government's income-contingent student loan program
- ② Research design: bunching at discontinuities before and after policy change
- ③ **Model**: life cycle model with endogenous labor supply + uninsurable wage risk
  - **Positive**: translate responses into estimates of preference parameters
  - **Normative**: characterize optimal amount and form of income-contingent repayment

Conditional on ex-ante choices, how does income-contingent repayment affect labor supply and **welfare**?

- ① Setting: Australian government's income-contingent student loan program
- ② Research design: bunching at discontinuities before and after policy change
- ③ **Model**: life cycle model with endogenous labor supply + uninsurable wage risk
  - **Positive**: translate responses into estimates of preference parameters
  - **Normative**: characterize optimal amount and form of income-contingent repayment
  - **Caveat**: compute optimal contracts taking ex-ante choices as given  $\approx$  **restructuring**

# MAIN RESULTS

- ① **Empirics:** borrowers reduce labor supply to ↓ income-contingent repayments
  - Larger responses in occupations with more hourly flexibility
  - Responses increase with liquidity constraints and decrease with  $P(\text{repayment})$
- ② **Structural estimation:** labor supply elasticity of **0.11** + adjustment frictions
- ③ **Contract design:** moral hazard reduces optimal amount of insurance
  - Fixed repayment → optimal income-contingent loan  $\Rightarrow \uparrow 1.3\%$  lifetime consumption
  - Forbearance + fixed repayment does worse because of slower repayment

# MAIN RESULTS

- ① **Empirics:** borrowers reduce labor supply to ↓ income-contingent repayments
  - Larger responses in occupations with more hourly flexibility
  - Responses increase with liquidity constraints and decrease with  $P(\text{repayment})$
- ② **Structural estimation:** labor supply elasticity of **0.11** + adjustment frictions
- ③ **Contract design:** moral hazard reduces optimal amount of insurance
  - Fixed repayment → optimal income-contingent loan  $\Rightarrow \uparrow 1.3\%$  lifetime consumption
  - Forbearance + fixed repayment does worse because of slower repayment

**Takeaway:** income-contingent repayment creates **moral hazard** that affects contract design, but **too small** to justify fixed repayment

# STUDENT LOANS IN AUSTRALIA: HELP

- Australian citizens eligible for government-provided student loans through **HELP**
- **Initial debt** = tuition – government contribution – upfront payment (avg.  $\approx \$20K$  USD)
- Debt grows at CPI net of **income-contingent repayments**:

$$\text{Repayment}_{it} = \text{HELP Rate}_t (\text{HELP Income}_{it}) \times \text{HELP Income}_{it}$$

$$\text{HELP Income}_{it} = \text{Labor Income}_{it} + \text{Capital Income}_{it} - \text{Deductions}_{it}$$

- Repayments continue until remaining debt balance equals zero or death
  - ✗ Cannot be cancelled or discharged in bankruptcy
  - Note: collection done from individual (not household) tax returns

► ICL Prevalence

► Variable Definitions

# WHY STUDY INCOME-CONTINGENT REPAYMENT IN AUSTRALIA?

- Benefit #1: only one government contract + no private market
  - Only choice is between borrowing and paying upfront; former **heavily** subsidized
  - ✓ Limited scope for **adverse selection** (or selection on moral hazard)
- Benefit #2: loans can only be used for tuition
  - Tuition is government-controlled at public universities (94% of enrollment)
  - ✓ Less room for **ex-ante** moral hazard from changes in borrowing
- Benefit #3: first nationwide provider of income-contingent loans in 1989
  - ✓ Borrowers likely **understand** structure of repayment

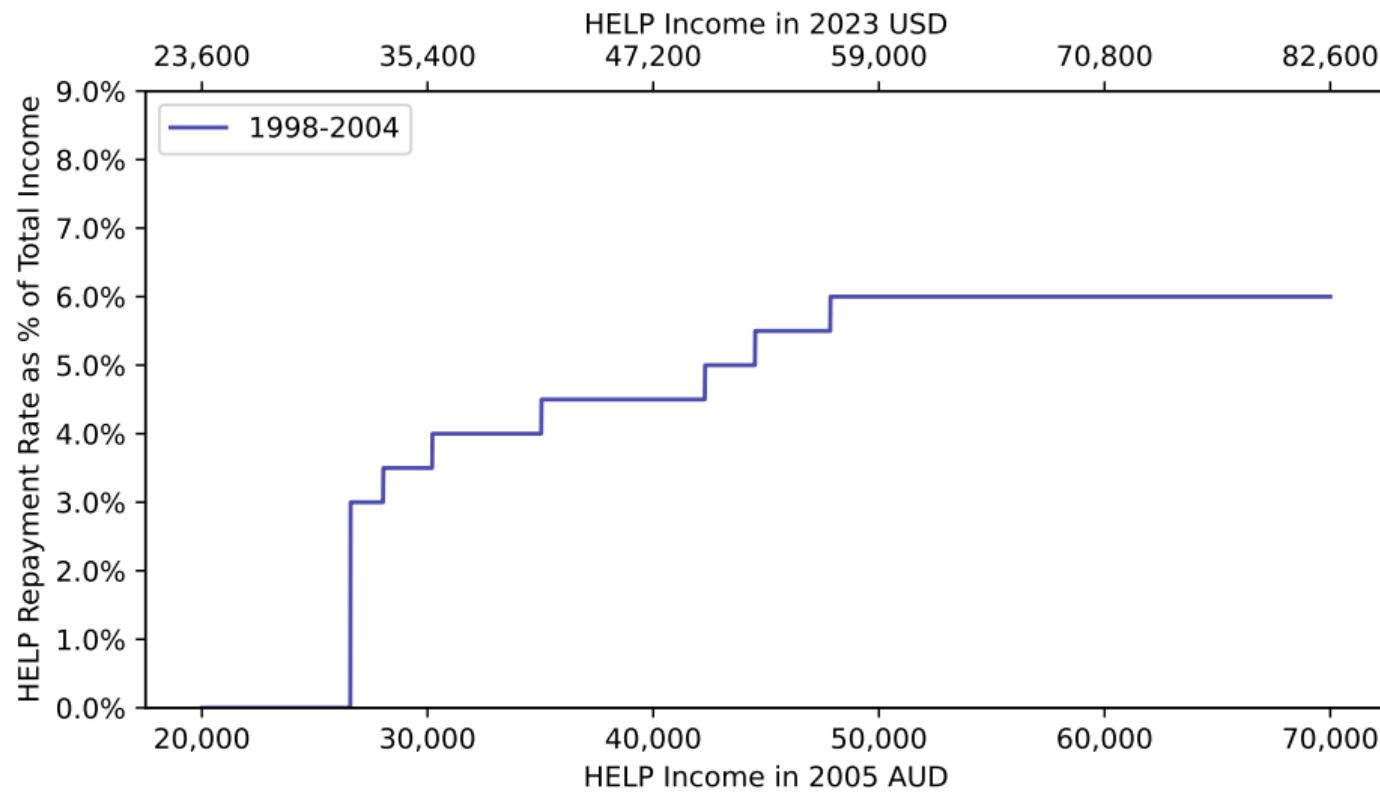

# WHY STUDY INCOME-CONTINGENT REPAYMENT IN AUSTRALIA?

► *b* Details

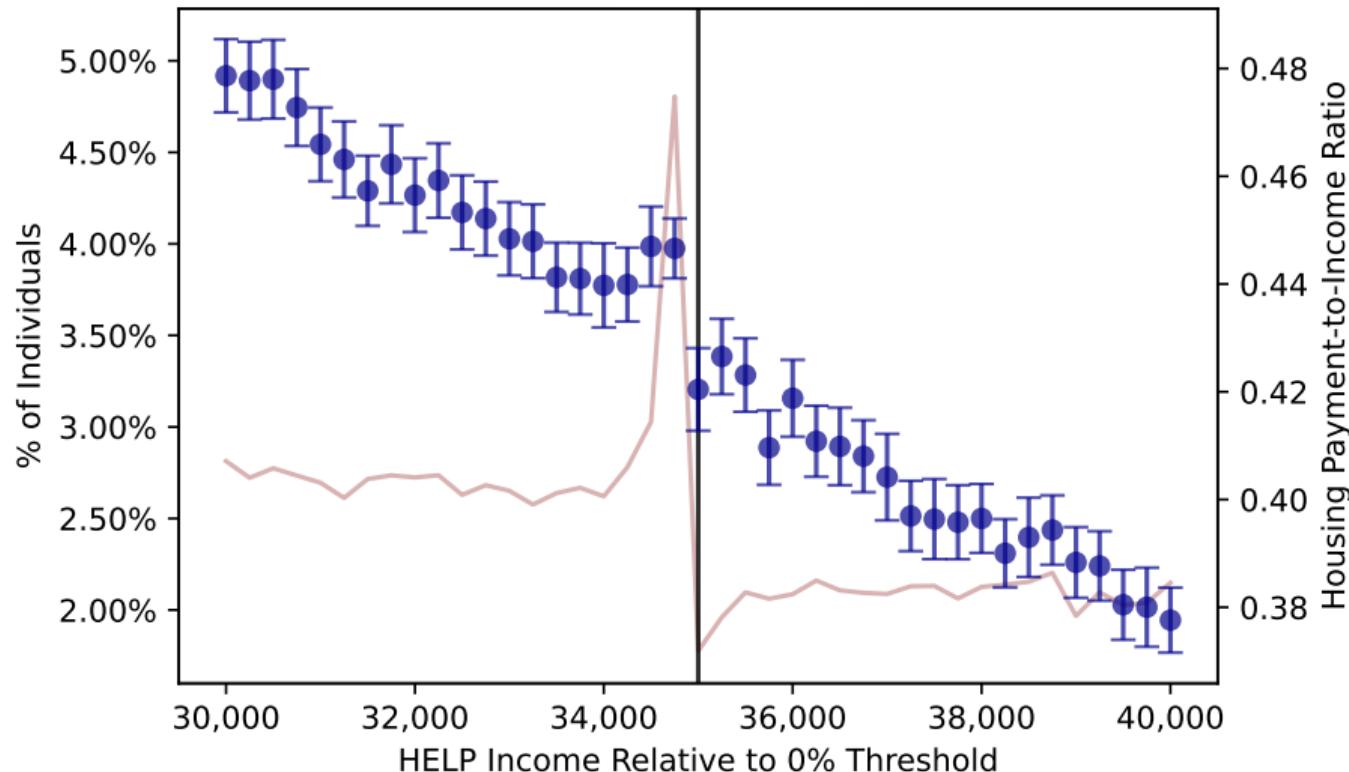

# P(REPAYMENT) MATTERS: BUNCHING INCREASES WITH DEBT

Note: confidence intervals omitted due to small size

► *b* Details

# BUNCHING INCREASES WITH PROXIES FOR LIQUIDITY CONSTRAINTS

► Retirement Savings

► House Prices

## Empirical facts:

► Additional Results

- ① Borrowers reduce income in response to income-contingent repayment
  - Reflects labor supply: “bunchers” work fewer hours and in more flexible occupations
- ② Size of responses depends on
  - **P(repayment)**: increases with debt, decreases with wage growth and peak
  - **Liquidity**: increases with liquidity demands, decreases with retirement wealth

## Empirical facts:

► Additional Results

- ① Borrowers reduce income in response to income-contingent repayment
  - Reflects labor supply: “bunchers” work fewer hours and in more flexible occupations
- ② Size of responses depends on
  - **P(repayment)**: increases with debt, decreases with wage growth and peak
  - **Liquidity**: increases with liquidity demands, decreases with retirement wealth

## Questions for model:

- ① How large are these labor supply responses quantitatively?
- ② Do they imply the costs of income-contingent repayment exceed the benefits?

- 1 Institutional Background and Data
- 2 Labor Supply Responses to Income-Contingent Repayment
- 3 Life Cycle Model with Endogenous Labor Supply
- 4 Welfare Impact of Income-Contingent Repayment
- 5 Conclusion

# MODEL DESCRIPTION

## OVERVIEW

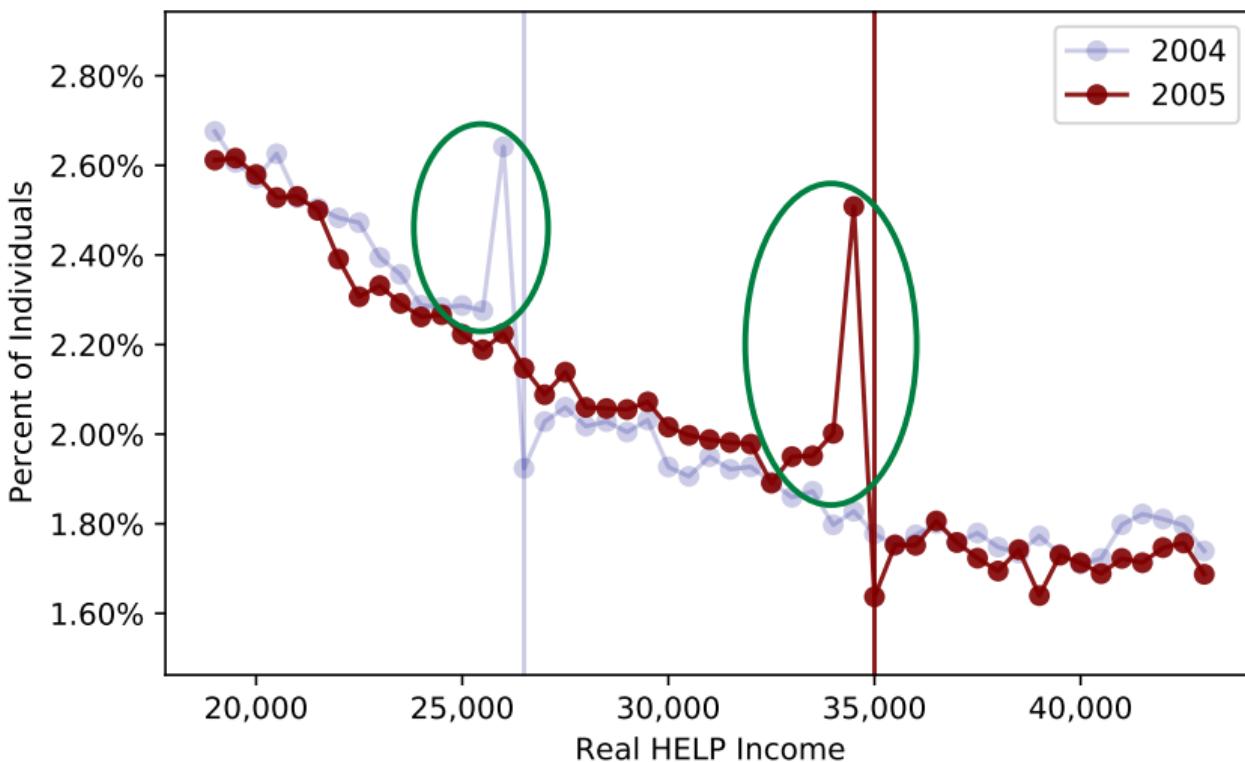

Life cycle model with debt + incomplete markets + endogenous labor supply

- Overlapping generations born at 22 with heterogeneous assets, wage, and debt
- From 22 to 64, individuals choose consumption,  $c_a$ , and labor supply,  $\ell_a$ 
  - Wage rate subject to idiosyncratic shocks (no aggregate risk, partial equilibrium)
  - Shocks are **uninsurable**: borrowing allowed up to age-dependent limit with interest
- After age 64, individuals retire and choose consumption  $c_a$

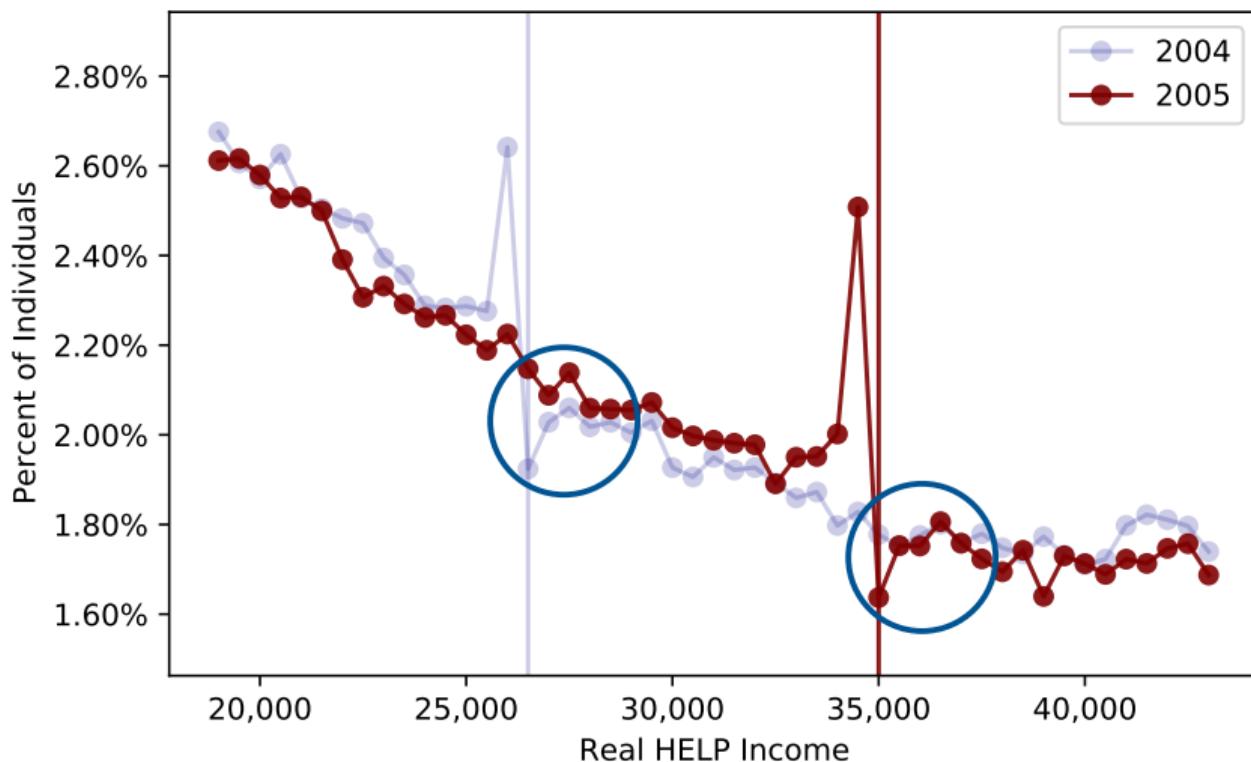

Life cycle model with debt + incomplete markets + endogenous labor supply

- Overlapping generations born at 22 with heterogeneous assets, wage, and debt
- From 22 to 64, individuals choose consumption,  $c_a$ , and labor supply,  $\ell_a$ 
  - Wage rate subject to idiosyncratic shocks (no aggregate risk, partial equilibrium)
  - Shocks are **uninsurable**: borrowing allowed up to age-dependent limit with interest
- After age 64, individuals retire and choose consumption  $c_a$
- **Government**
  - Revenues: progressive income taxes, debt repayments
  - Expenses: means-tested unemployment benefits & retirement pension, initial debt

# BUNCHING CONSISTENT WITH POSITIVE LABOR SUPPLY ELASTICITY

# MASS ABOVE THRESHOLD INCONSISTENT WITH FRICTIONLESS MODEL

- Moving above to below threshold  $\Rightarrow$  more leisure **and** \$1400 more cash-on-hand

- Choice of  $\ell_a$  subject to two **optimization frictions** to give mass above threshold
  - Similar to models of pricing Nakamura-Steinsson 2010 and refinancing Andersen et al. 2020

## ① Canonical model of **time**-dependent adjustment (Calvo):

- Fraction  $\lambda$  hit by shock and adjust  $\ell_a$ , other  $1 - \lambda$  set  $\ell_a = \ell_{a-1}$
- E.g., inattention, arrival of opportunities to change hours/jobs

## ② Canonical model of **state**-dependent adjustment (sS):

- Individuals hit by **Calvo shock** incur utility cost  $f$ , if they choose  $\ell_a \neq \ell_{a-1}$
- E.g., real or psychological costs of changing hours/jobs

- Choice of  $\ell_a$  subject to two **optimization frictions** to give mass above threshold
    - Similar to models of pricing Nakamura-Steinsson 2010 and refinancing Andersen et al. 2020
- ① Canonical model of **time**-dependent adjustment (Calvo):
    - Fraction  $\lambda$  hit by shock and adjust  $\ell_a$ , other  $1 - \lambda$  set  $\ell_a = \ell_{a-1}$
    - E.g., inattention, arrival of opportunities to change hours/jobs
  - ② Canonical model of **state**-dependent adjustment (sS):
    - Individuals hit by **Calvo shock** incur utility cost  $f$ , if they choose  $\ell_a \neq \ell_{a-1}$
    - E.g., real or psychological costs of changing hours/jobs
    - Robustness: linear adjustment costs
  - Extension: add learning-by-doing to generate long-run cost of bunching

$$c_a + A_{a+1} + d(y_a, D_a, t) + \tau(y_a) = y_a + A_a R$$

$$y_a = \ell_a w_a, \quad \log w_a = g_a + \theta_a + \epsilon_a$$

$$\mathbf{s}_a = (a \quad t \quad A_a \quad D_a \quad \theta_a \quad \epsilon_a \quad \ell_{a-1} \quad \omega_a)$$

- $\theta_a$  = permanent income =  $\rho \theta_{a-1} + \nu_a$   $\nu_a \sim N(0, \sigma_\nu^2)$
- $\epsilon_a$  = transitory shock  $\sim N(0, \sigma_\epsilon^2)$

# OPTIMIZATION PROBLEM OF INDIVIDUALS HIT BY CALVO SHOCK

$$V_a(\mathbf{s}_a) = \max_{\substack{A_{a+1} \geq A_{a+1}, \\ \ell_a}} \left\{ \left[ c_a - \kappa \frac{\ell_a^{1+\phi^{-1}}}{1 + \phi^{-1}} - f * \mathbf{1}_{\ell_a \neq \ell_{a-1}} \right]^{1-\sigma} + \beta \left[ m_a \mathbf{E}_{\mathbf{a}} (V_{a+1}(\mathbf{s}_{a+1})^{1-\gamma}) \right]^{\frac{1-\sigma}{1-\gamma}} \right\}^{\frac{1}{1-\sigma}}$$

$$c_a + A_{a+1} + d(y_a, D_a, t) + \tau(y_a) = y_a + A_a R$$

$$y_a = \ell_a w_a, \quad \log w_a = g_a + \theta_a + \epsilon_a$$

$$\mathbf{s}_a = (a \quad t \quad A_a \quad D_a \quad \theta_a \quad \epsilon_a \quad \ell_{a-1} \quad \omega_a)$$

- $\theta_a$  = permanent income =  $\rho \theta_{a-1} + \nu_a + \alpha \log \ell_{a-1}$     $\nu_a \sim N(0, \sigma_\nu^2)$
- $\epsilon_a$  = transitory shock  $\sim N(0, \sigma_\epsilon^2)$       Extension: learning-by-doing

# OPTIMIZATION PROBLEM OF INDIVIDUALS HIT BY CALVO SHOCK

$$V_a(\mathbf{s}_a) = \max_{\substack{A_{a+1} \geq A_{a+1}, \\ \ell_a}} \left\{ \left[ c_a - \kappa \frac{\ell_a^{1+\phi^{-1}}}{1 + \phi^{-1}} - f * \mathbf{1}_{\ell_a \neq \ell_{a-1}} \right]^{1-\sigma} + \beta \left[ m_a \mathbf{E}_{\mathbf{a}} (V_{a+1}(\mathbf{s}_{a+1})^{1-\gamma}) \right]^{\frac{1-\sigma}{1-\gamma}} \right\}^{\frac{1}{1-\sigma}}$$

$$c_a + A_{a+1} + d(y_a, D_a, t) + \tau(y_a) = y_a + A_a R$$

$$y_a = \ell_a w_a, \quad \log w_a = g_a + \theta_a + \epsilon_a$$

$$\mathbf{s}_a = (a \quad t \quad A_a \quad D_a \quad \theta_a \quad \epsilon_a \quad \ell_{a-1} \quad \omega_a)$$

- $\ell_{a-1}$  = labor supply from previous period
- $\omega_a$  = Calvo shock that determines whether  $\ell_a$  can be adjusted  $\sim$  Bernoulli( $\lambda$ )

# OPTIMIZATION PROBLEM OF INDIVIDUALS HIT BY CALVO SHOCK

$$V_a(\mathbf{s}_a) = \max_{\substack{A_{a+1} \geq A_{a+1}, \\ \ell_a}} \left\{ \left[ c_a - \kappa \frac{\ell_a^{1+\phi^{-1}}}{1 + \phi^{-1}} - f * \mathbf{1}_{\ell_a \neq \ell_{a-1}} \right]^{1-\sigma} + \beta \left[ m_a \mathbf{E}_{\mathbf{a}} (V_{a+1}(\mathbf{s}_{a+1})^{1-\gamma}) \right]^{\frac{1-\sigma}{1-\gamma}} \right\}^{\frac{1}{1-\sigma}}$$

$$c_a + A_{a+1} + d(y_a, D_a, t) + \tau(y_a) = y_a + A_a R$$

$$y_a = \ell_a w_a, \quad \log w_a = g_a + \theta_a + \epsilon_a$$

$$\mathbf{s}_a = (a \quad t \quad A_a \quad D_a \quad \theta_a \quad \epsilon_a \quad \ell_{a-1} \quad \omega_a)$$

- Sources of ex-ante heterogeneity:
  - $\theta_0$  = initial permanent income  $\sim N(0, \sigma_i^2)$
  - $D_0$  = initial debt,  $A_0$  = initial assets

# ESTIMATION

- **Interest rates and borrowing:**
  - Interest rate = 1.84%, borrowing rate = CC rate, debt interest rate = 0%
  - Borrowing limit = average CC limit by age
- **Demographics:** cohort birth rates and mortality risk taken from life tables
  - Consumption adjusted for equivalence scale using HH size (Lusardi et al. 2017)
- **Government:** use exact (non-smooth) formulas provided by tax office
- **Initial conditions:** assets and debt distributions taken from data at age 22
- **Baseline RRA and EIS:**  $\gamma = \frac{1}{\sigma} = 2.23$  (Choukhmane-de Silva 2023)
  - Welfare analysis: consider alternative values + preference for early resolution

- **Interest rates and borrowing:**
  - Interest rate = 1.84%, borrowing rate = CC rate, debt interest rate = 0%
  - Borrowing limit = average CC limit by age
- **Demographics:** cohort birth rates and mortality risk taken from life tables
  - Consumption adjusted for equivalence scale using HH size (Lusardi et al. 2017)
- **Government:** use exact (non-smooth) formulas provided by tax office
- **Initial conditions:** assets and debt distributions taken from data at age 22

  - Welfare analysis: consider alternative values + preference for early resolution
- **Learning-by-doing extension:**  $\alpha = 0.24$  (median value from Best-Kleven 2013)

## SECOND-STAGE SIMULATED METHOD OF MOMENTS

$$\text{Parameters} = \begin{pmatrix} & \\ & \\ & \end{pmatrix}$$

- **Estimation** via SMM with 47 moments + 14 parameters
    - Find parameters that minimize % difference between data & model moments
  - **Simulated policy change:** unanticipated change in HELP formula at  $t = 2005$

## SECOND-STAGE SIMULATED METHOD OF MOMENTS: IDENTIFICATION

$$\text{Parameters} = \left( \begin{array}{c} \overbrace{\phi \ f \ \lambda}^{\text{labor supply}} \\ \end{array} \right)$$

- **Labor supply elasticity:** identified by bunching below repayment threshold
- **Frictions:** identified by mass above repayment threshold

## SECOND-STAGE SIMULATED METHOD OF MOMENTS: IDENTIFICATION

$$\text{Parameters} = \begin{pmatrix} \text{labor supply} \\ \phi \ f \ \lambda \end{pmatrix}$$

- **Labor supply elasticity:** identified by bunching below repayment threshold
- **Frictions:** identified by mass above repayment threshold
- Separate identification of frictions
  - **Intuition:** with  $f = 0$ , decision to bunch depends on Calvo shock not incentives
  - Moments: heterogeneity in bunching with **debt**, bunching at **0.5%** threshold

## SECOND-STAGE SIMULATED METHOD OF MOMENTS: IDENTIFICATION

$$\text{Parameters} = \left( \underbrace{\phi \ f \ \lambda}_{\text{preferences}} \ \underbrace{\kappa \ \beta}_{\text{labor supply}} \ \underbrace{\delta_0 \ \delta_1 \ \delta_2}_{\text{wage profile}} \ \underbrace{\delta_0^E \ \delta_1^E}_{\text{wage risk}} \ \underbrace{\rho \ \sigma_\nu \ \sigma_\epsilon \ \sigma_i}_{\text{wage risk}} \right)$$

- Labor supply elasticity: identified by bunching below repayment threshold
- Frictions: identified by mass above repayment threshold
- Separate identification of frictions
  - **Intuition:** with  $f = 0$ , decision to bunch depends on Calvo shock not incentives
  - Moments: heterogeneity in bunching with **debt**, bunching at **0.5%** threshold
- No panel data on **hours**  $\Rightarrow$  wage profile & wage risk estimated **jointly**

# OUTLINE

- 1 Institutional Background and Data
- 2 Labor Supply Responses to Income-Contingent Repayment
- 3 Life Cycle Model with Endogenous Labor Supply
- 4 Welfare Impact of Income-Contingent Repayment
- 5 Conclusion

Conditional on government subsidy for higher education, what repayment contract best balances **insurance** with **moral hazard**?

- Consider social planner that maximizes borrower welfare with **one** contract
  - Problem faced by governments with one contract (e.g., Australia, UK)
  - Contract is subsidized with zero interest rate, prices held fixed
  - **Caveat:** borrowing and education choices held fixed  $\approx$  debt **restructuring**

Conditional on government subsidy for higher education, what repayment contract best balances **insurance** with **moral hazard**?

- Consider social planner that maximizes borrower welfare with **one** contract
  - Problem faced by governments with one contract (e.g., Australia, UK)
  - Contract is subsidized with zero interest rate, prices held fixed
  - **Caveat:** borrowing and education choices held fixed  $\approx$  debt **restructuring**
- **Three** ways to provide **insurance**:
  - ① Within-individuals over the life cycle
  - ② Across ex-post states at each age (e.g., wage shocks)
  - ③ Across ex-ante states (e.g., initial ability)
- **Two** forms of **moral hazard**: bunching + intensive-margin responses

# CONSTRAINED-OPTIMAL INCOME-CONTINGENT LOANS

Find solution to **constrained**-planner's problem with income-contingent loans:

$$\max \mathbf{E}_0 \left( V_{a_0}^{1-\gamma} \right)^{\frac{1}{1-\gamma}} \quad (\text{behind the "veil-of-ignorance"})$$

# CONSTRAINED-OPTIMAL INCOME-CONTINGENT LOANS

Find solution to **constrained**-planner's problem with income-contingent loans:

$$\max_{\psi, K} \mathbf{E}_0 \left( V_{a_0}^{1-\gamma} \right)^{\frac{1}{1-\gamma}}$$

subject to: (à la Ramsey, not Mirrlees)

$$\text{Repayments}_a = \psi * \max \{y_a - K, 0\} \quad (\text{US/UK}) \quad (1)$$

# CONSTRAINED-OPTIMAL INCOME-CONTINGENT LOANS

Find solution to **constrained**-planner's problem with income-contingent loans:

$$\max_{\psi, K} \mathbf{E}_0 \left( V_{a_0}^{1-\gamma} \right)^{\frac{1}{1-\gamma}}$$

subject to:

$$\text{Repayments}_a = \min \left\{ \psi * \max \{y_a - K, 0\}, D_a \right\} \quad (1)$$

# CONSTRAINED-OPTIMAL INCOME-CONTINGENT LOANS

Find solution to **constrained**-planner's problem with income-contingent loans:

$$\max_{\psi, K} \mathbf{E}_0 \left( V_{a_0}^{1-\gamma} \right)^{\frac{1}{1-\gamma}}$$

subject to:

$$\text{Repayments}_a = \min \left\{ \psi * \max \{y_a - K, 0\}, D_a \right\} \quad (1)$$

$$\mathcal{G} \equiv \mathbf{E}_0 \sum_{a=a_0}^{a_T} \frac{\text{Repayments}_a + \text{Taxes}_a - \text{Transfers}_a}{\mathcal{R}_a}$$

# CONSTRAINED-OPTIMAL INCOME-CONTINGENT LOANS

Find solution to **constrained**-planner's problem with income-contingent loans:

$$\max_{\psi, K} \mathbf{E}_0 \left( V_{a_0}^{1-\gamma} \right)^{\frac{1}{1-\gamma}}$$

subject to:

$$\text{Repayments}_a = \min \left\{ \psi * \max \{y_a - K, 0\}, D_a \right\} \quad (1)$$

$$\mathcal{G} \equiv \mathbf{E}_0 \sum_{a=a_0}^{a_T} \frac{\text{Repayments}_a + \text{Taxes}_a - \text{Transfers}_a}{\mathcal{R}_a}$$

$$\frac{1}{\mathcal{R}_a} = \underbrace{\beta^{a-a_0}}_{\text{individual time preference}} * \underbrace{\prod_{s=0}^{a-a_0} m_s}_{\text{mortality}}$$

Robustness with  $\mathcal{R}_a$  = risk-free rate and risk-free rate + 4%

# CONSTRAINED-OPTIMAL INCOME-CONTINGENT LOANS

Find solution to **constrained**-planner's problem with income-contingent loans:

$$\max_{\psi, K} \mathbf{E}_0 \left( V_{a_0}^{1-\gamma} \right)^{\frac{1}{1-\gamma}}$$

subject to:

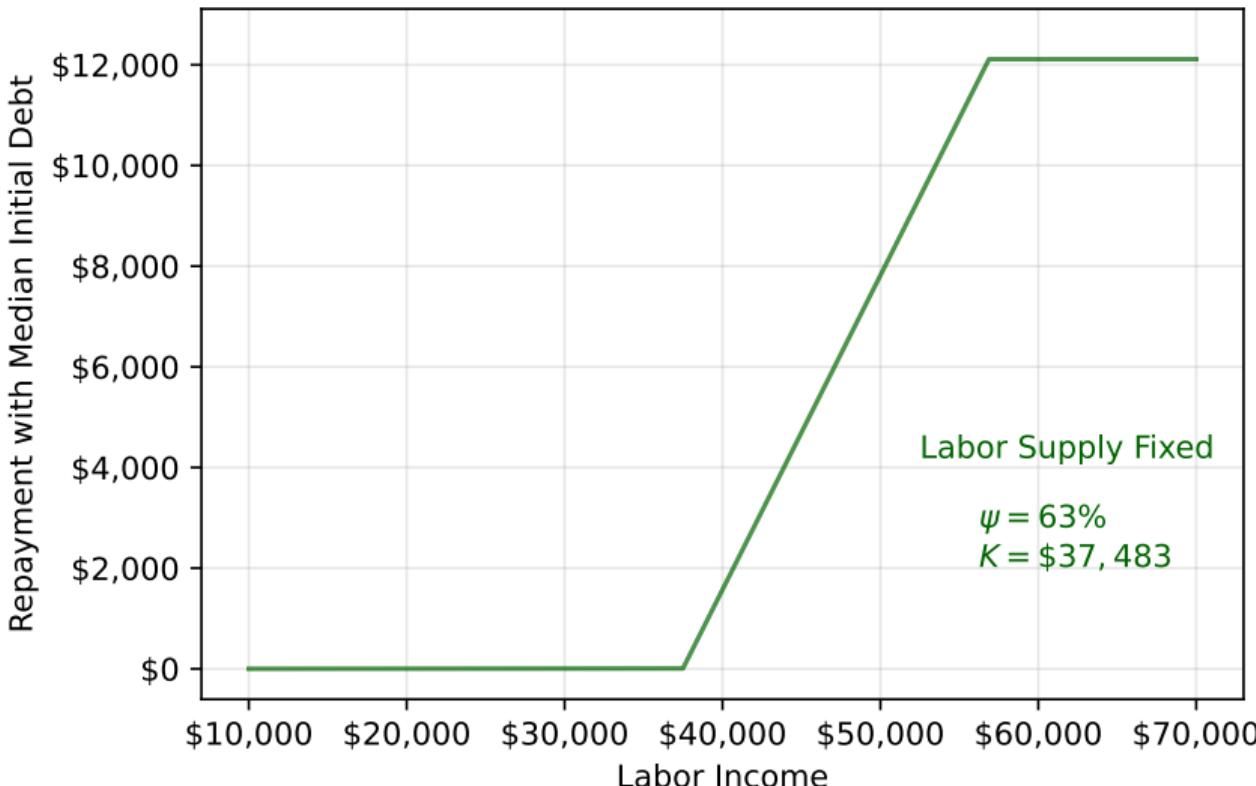

$$\text{Repayments}_a = \min \left\{ \psi * \max \{y_a - K, 0\}, D_a \right\} \quad (1)$$

$$\mathbf{E}_0 \sum_{a=a_0}^{a_T} \frac{\text{Repayments}_a + \text{Taxes}_a - \text{Transfers}_a}{\mathcal{R}_a} \geq \mathcal{G}_{25\text{-Year Fixed}} \quad (2)$$

$$\frac{1}{\mathcal{R}_a} = \underbrace{\beta^{a-a_0}}_{\text{individual time preference}} * \underbrace{\prod_{s=0}^{a-a_0} m_s}_{\text{mortality}}$$

Robustness with  $\mathcal{R}_a$  = risk-free rate and risk-free rate + 4%

# SOLUTION TO CONSTRAINED-PLANNER'S PROBLEM

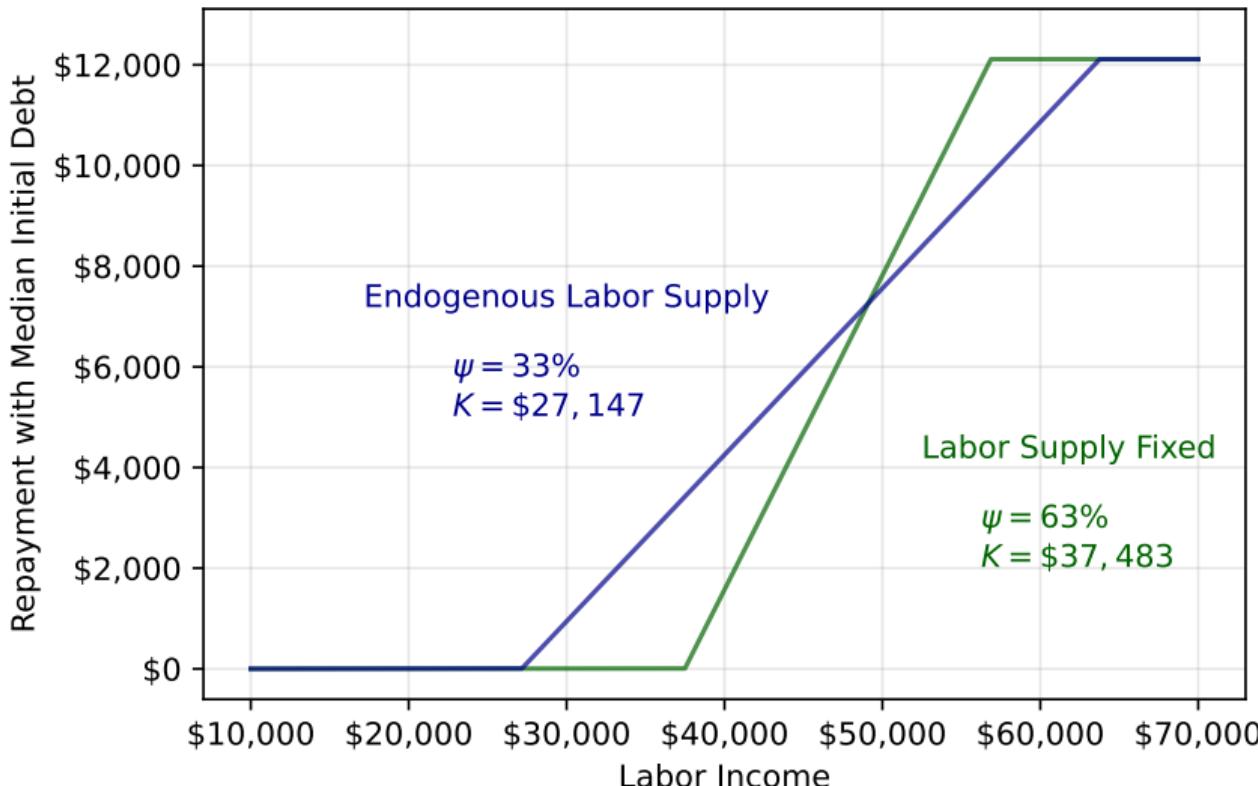

► Smooth Contract

► Compare with Existing

► Non-Budget-Neutral

# SOLUTION TO CONSTRAINED-PLANNER'S PROBLEM

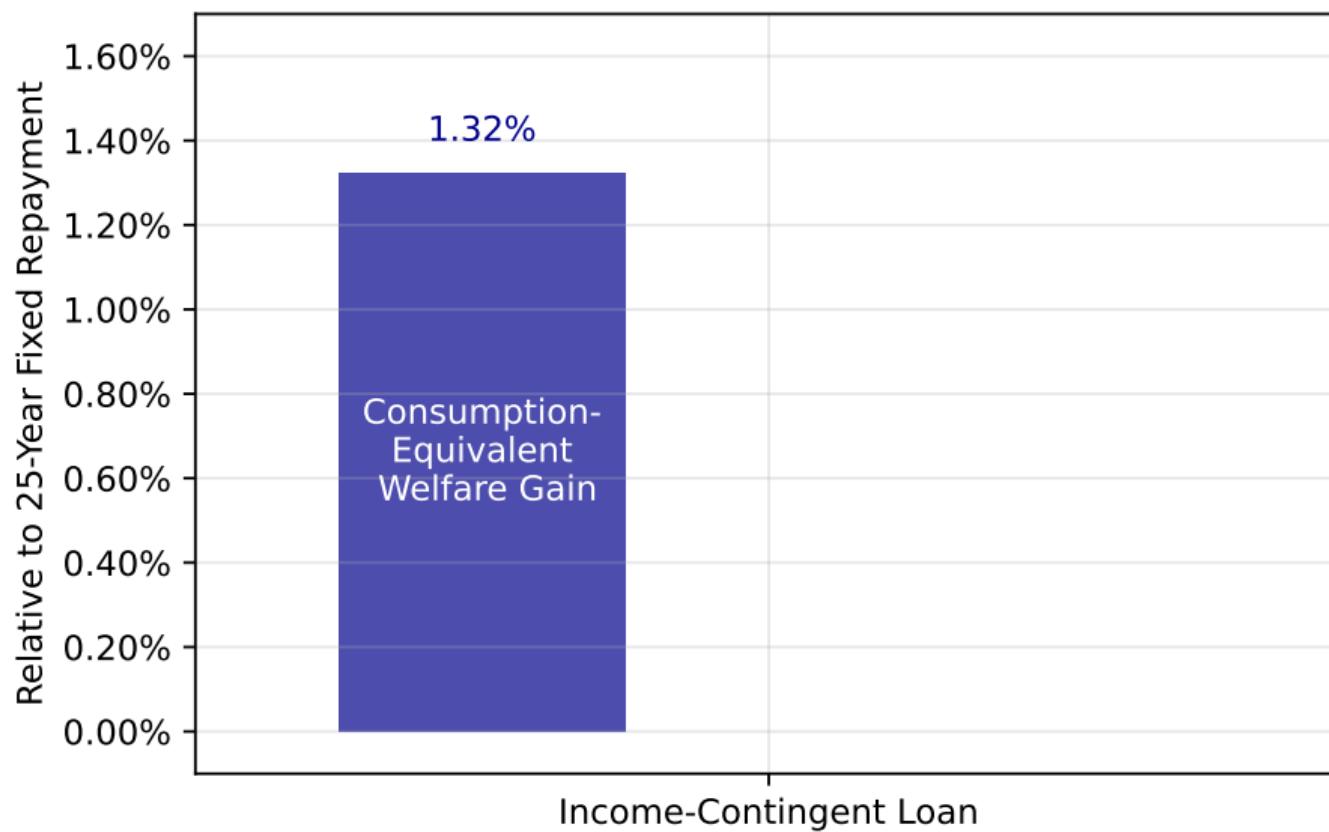

► Smooth Contract

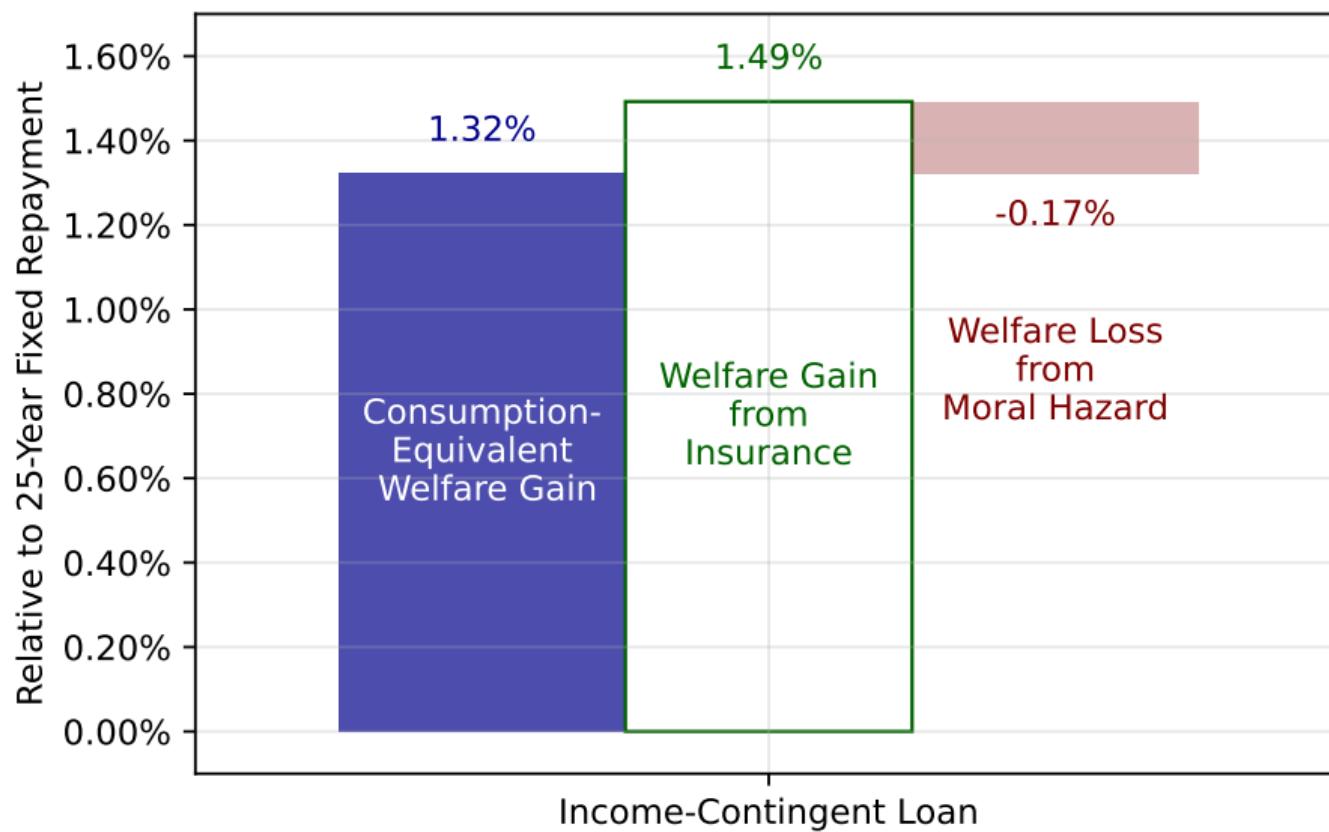

► Compare with Existing

► Non-Budget-Neutral

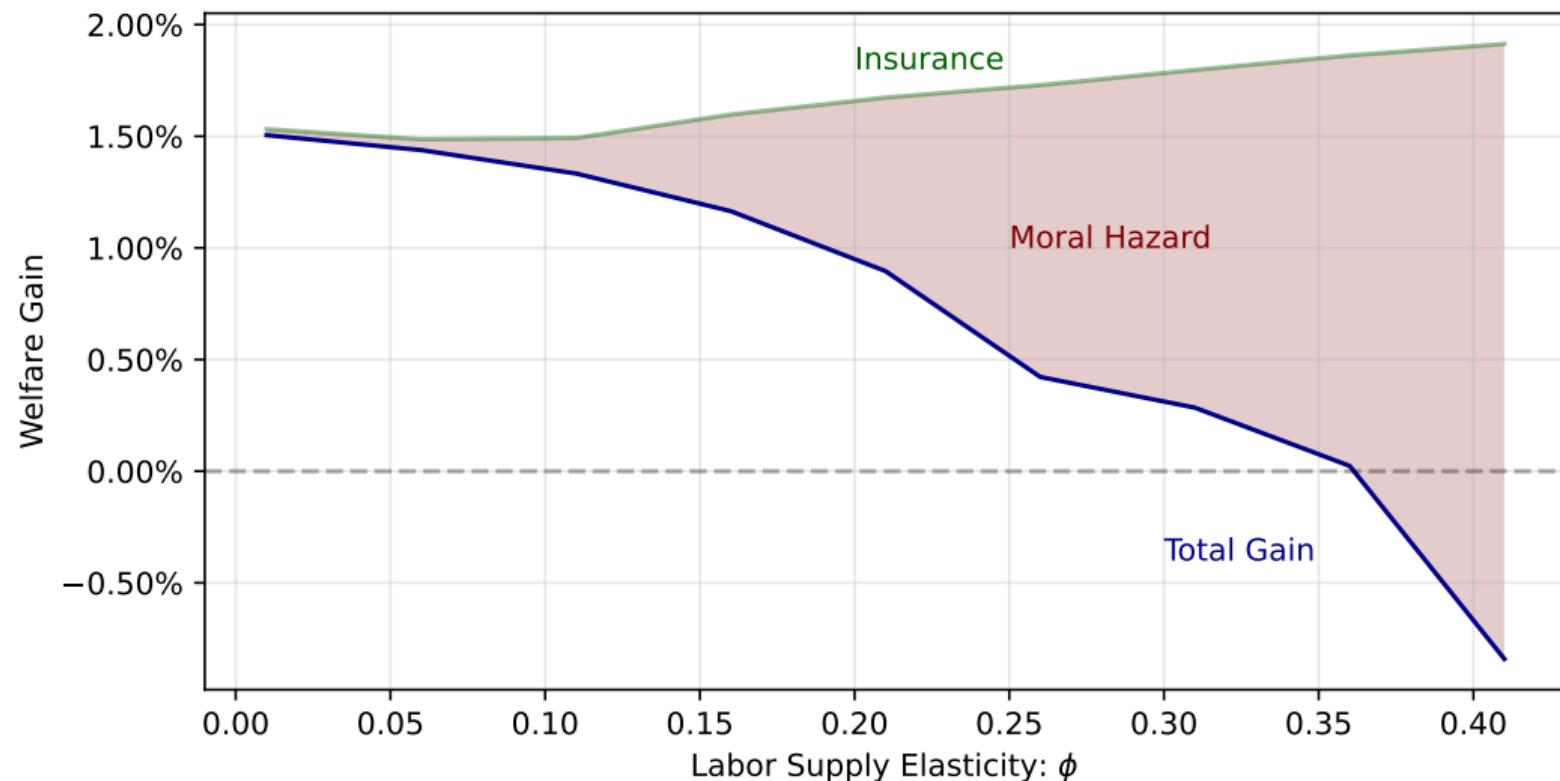

## CONSTRAINED-OPTIMUM = 1.3% INCREASE IN LIFETIME CONSUMPTION

# CONSTRAINED-OPTIMUM = 1.3% INCREASE IN LIFETIME CONSUMPTION

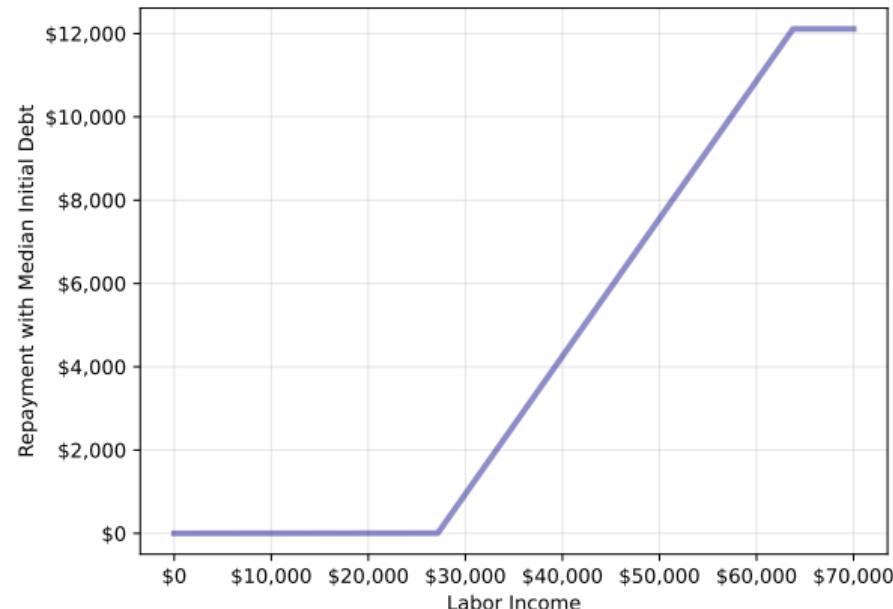

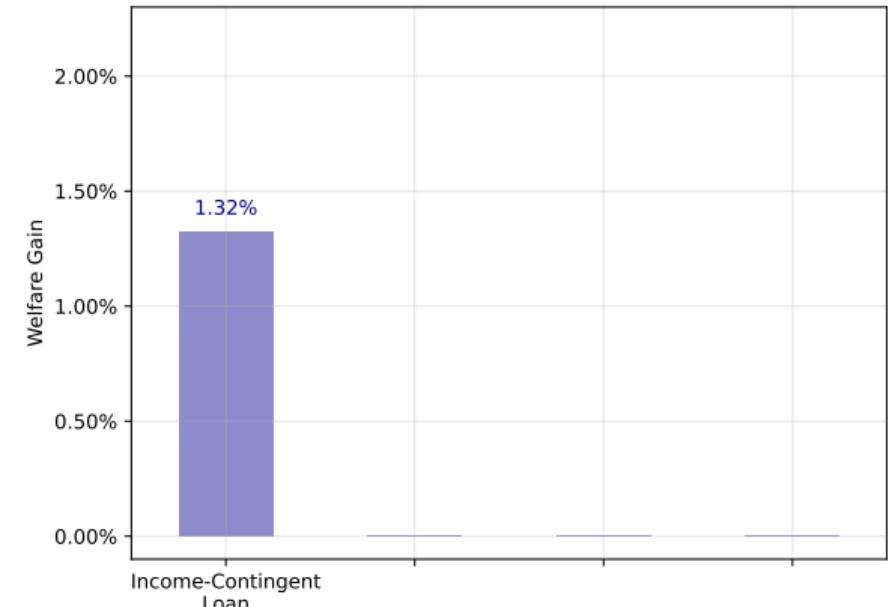

# WELFARE GAIN IS POSITIVE AS LONG AS $\phi < 0.37$

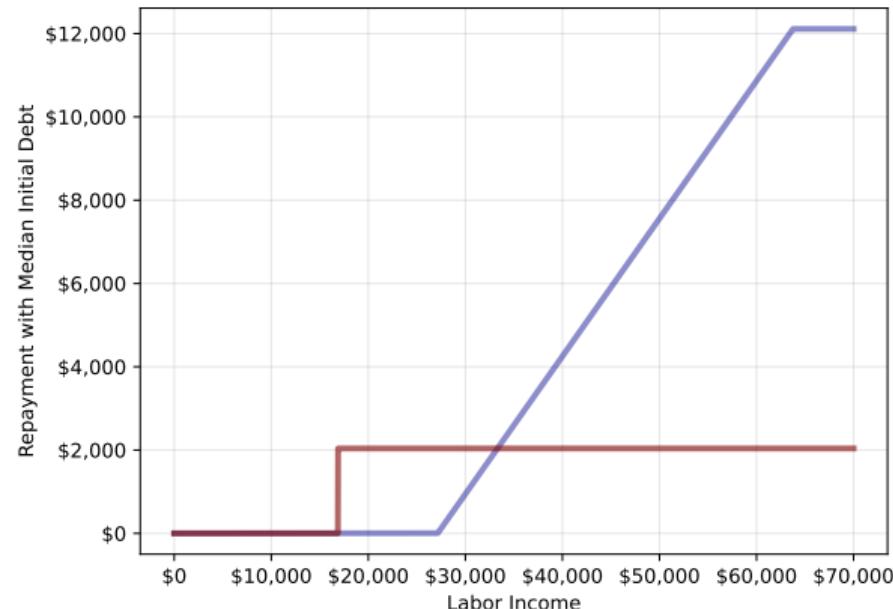

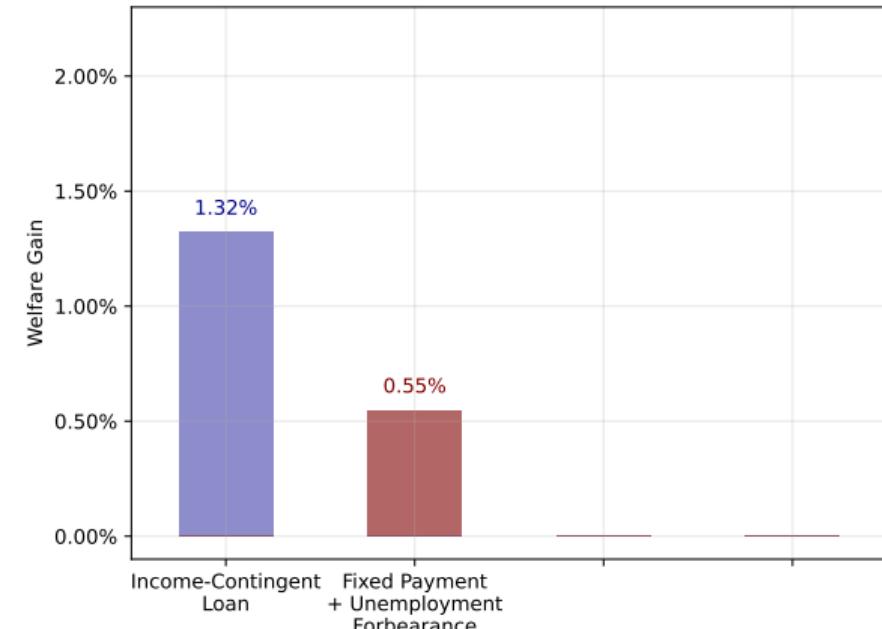

- ▶ Bunching at  $\phi = 0.37$
- ▶ Contracts to Reduce MH
- ▶ Robustness: Frictions
- ▶ Robustness: RRA + EIS

## NEXT: ICLs vs. OTHER CONSTRAINED-OPTIMAL CONTRACTS...

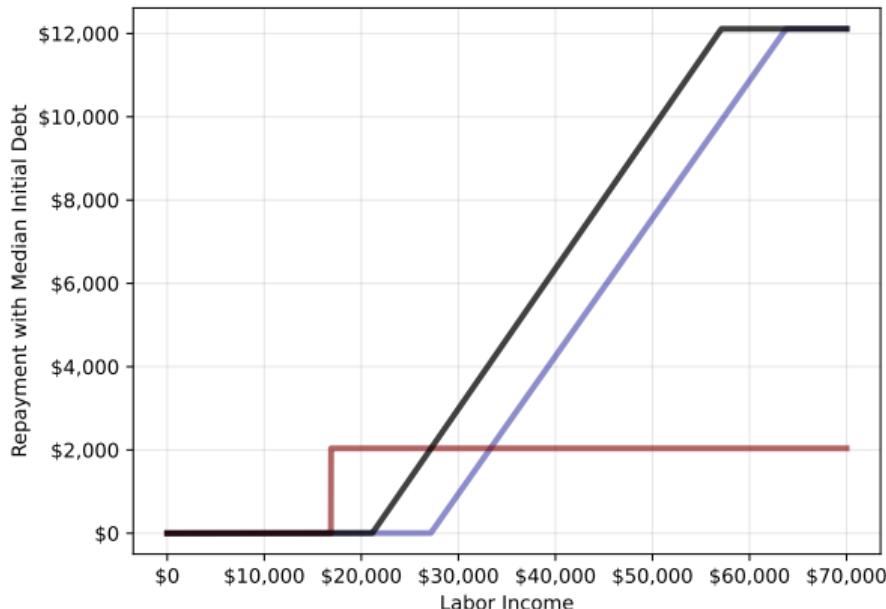

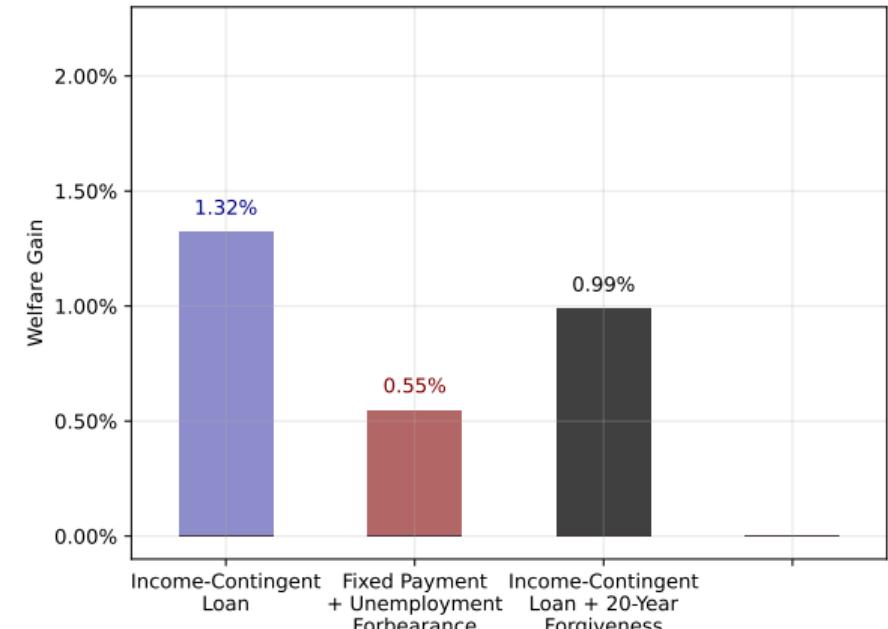

# JUST PROVIDING FORBEARANCE GIVES SMALLER GAINS

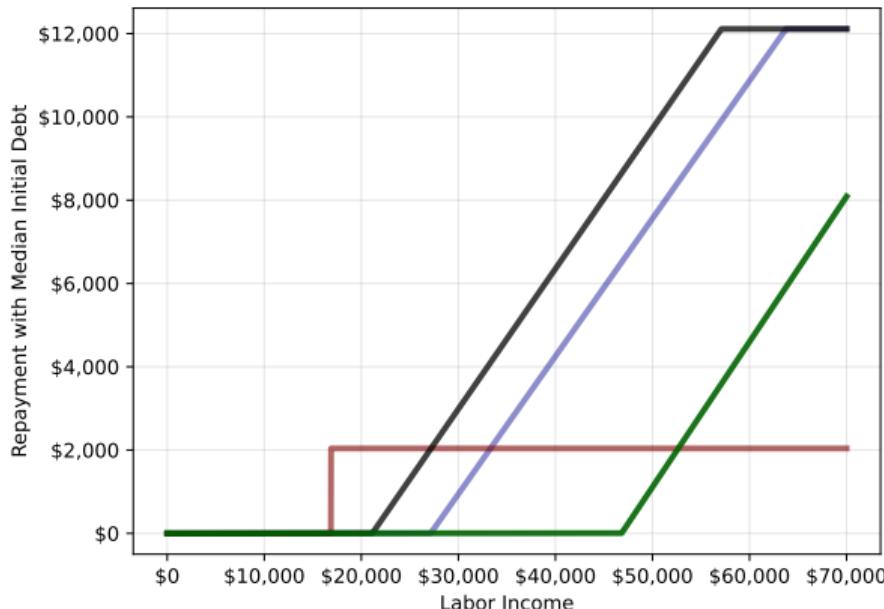

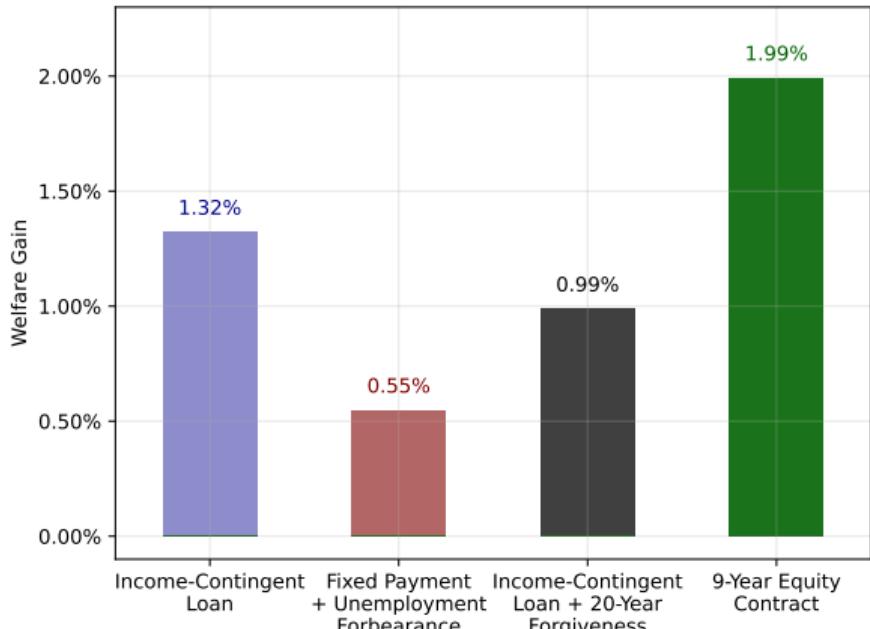

- **Benefit** of income-contingent loan: accelerate payments from high-income

# ADDING FORGIVENESS REDUCES WELFARE GAINS

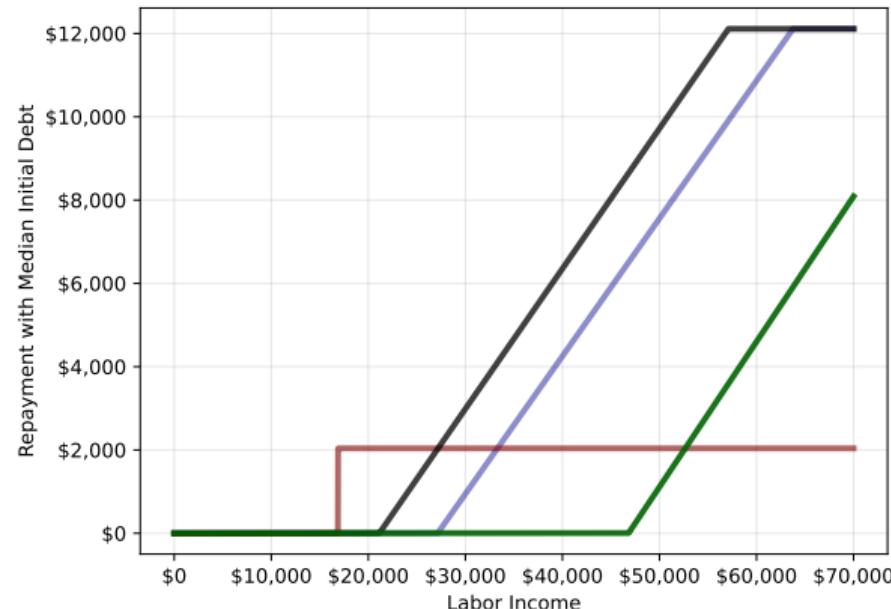

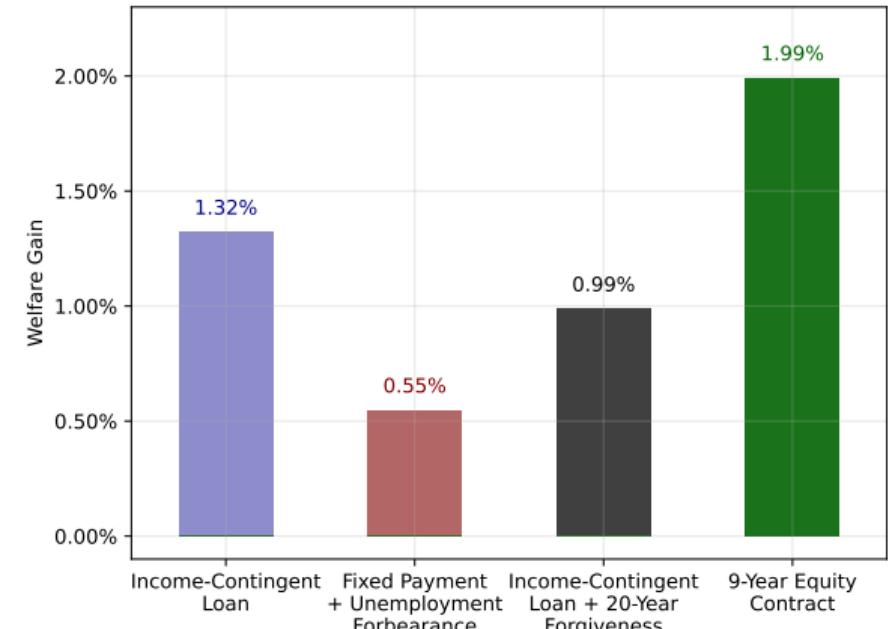

- **Costs** of forgiveness: transfer repayments to young and finite repayment horizon

# EQUITY CONTRACT GIVES LARGER GAINS

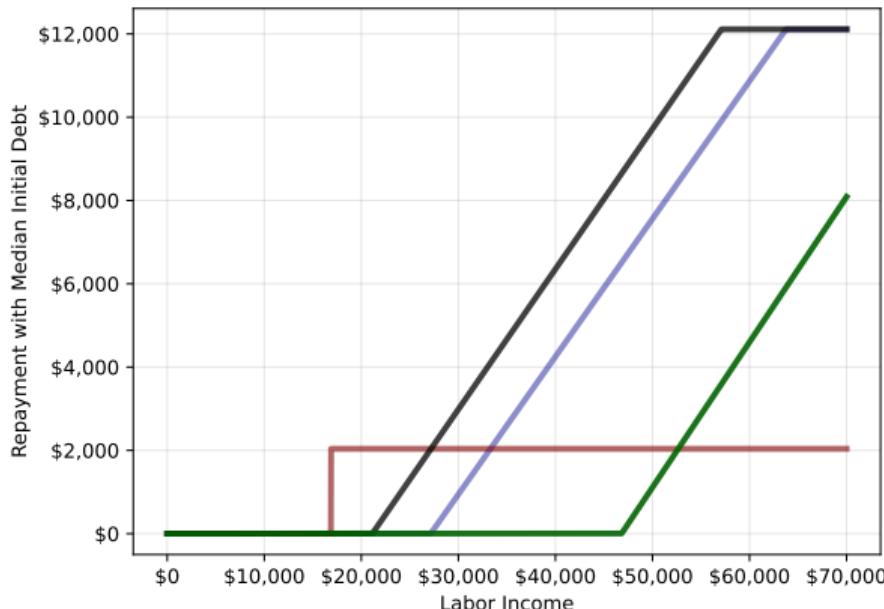

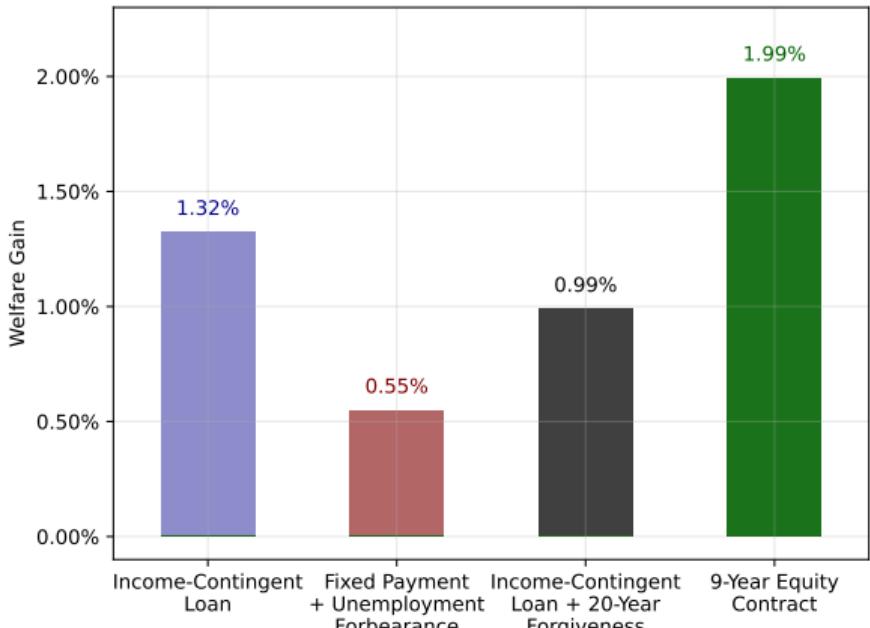

- **Benefit of equity:** uncapped payments from high-income  $\Rightarrow$  70% higher threshold

# EQUITY CONTRACT GIVES LARGER GAINS, BUT MORE DISPERSED

- **Cost** of equity: more likely to cause losses from **ex-ante** responses and **selection**

# EQUITY CONTRACT GIVES LARGER GAINS, BUT MORE DISPERSED

- **Cost** of equity: more likely to cause losses from **ex-ante** responses and **selection**

▶ Heterogeneity

▶ Additional Results

# OUTLINE

- 1 Institutional Background and Data
- 2 Labor Supply Responses to Income-Contingent Repayment
- 3 Life Cycle Model with Endogenous Labor Supply
- 4 Welfare Impact of Income-Contingent Repayment
- 5 Conclusion

- US “student debt crisis”: 25% of borrowers default within 5 years of graduation
  - Possible solution = change contracts to be **income-contingent** (e.g., SAVE)
- **This paper:** evidence + model to calibrate the effects of debt restructuring
  - ① Ex-post moral hazard is not a reason to avoid **income-contingent** contracts
  - ② Among these contracts, **income-contingent loans** are relatively effective and robust
- **Open question:** effects of income-contingent contracts on ex-ante choices?
- **Broader question:** is more state-contingent repayment useful for other liabilities?
  - HHs: government-provided shared-appreciation mortgages (UK, Canada)
  - Firms: revenue-based financing

## VARIABLE DEFINITIONS

- HELP Income = Taxable Income + Fringe Benefits + Foreign Employment Income + Investment or Property Losses + Employer Super Contributions
- Labor Income = Salary/Wages + Allowances & Tips + Self-Employment Income
- Capital Income = Interest and Dividend Income + Annuity Income + Capital Gains + Rental Income + Managed Trust Income
- Net Deductions = Labor Income + Capital Income - HELP Income

◀ Back

# AU-US DIFFERENCES MOST LIKELY TO AFFECT CONTRACT DESIGN

- ① More debt in US due to higher tuition, longer degrees, and discretionary items
  - Larger demand for insurance in US, but also more moral hazard
  - Discretionary borrowing in US ⇒ possible ex-ante moral hazard
- ② Active private market in US cream-skims high-income borrowers Bachas 2019
  - Amount of insurance that can be provided might be lower in US
- ③ Student loans more subsidized in Australia than US
  - Different moral hazard in US (if there is selection on moral hazard) Karlan-Zinman 2009
- ④ Tuition and enrollment caps at public universities in Australia
  - Supply-side responses could increase fiscal cost of ICLs in US Kargar-Mann 2023
  - Note: I compare contracts with identical subsidy

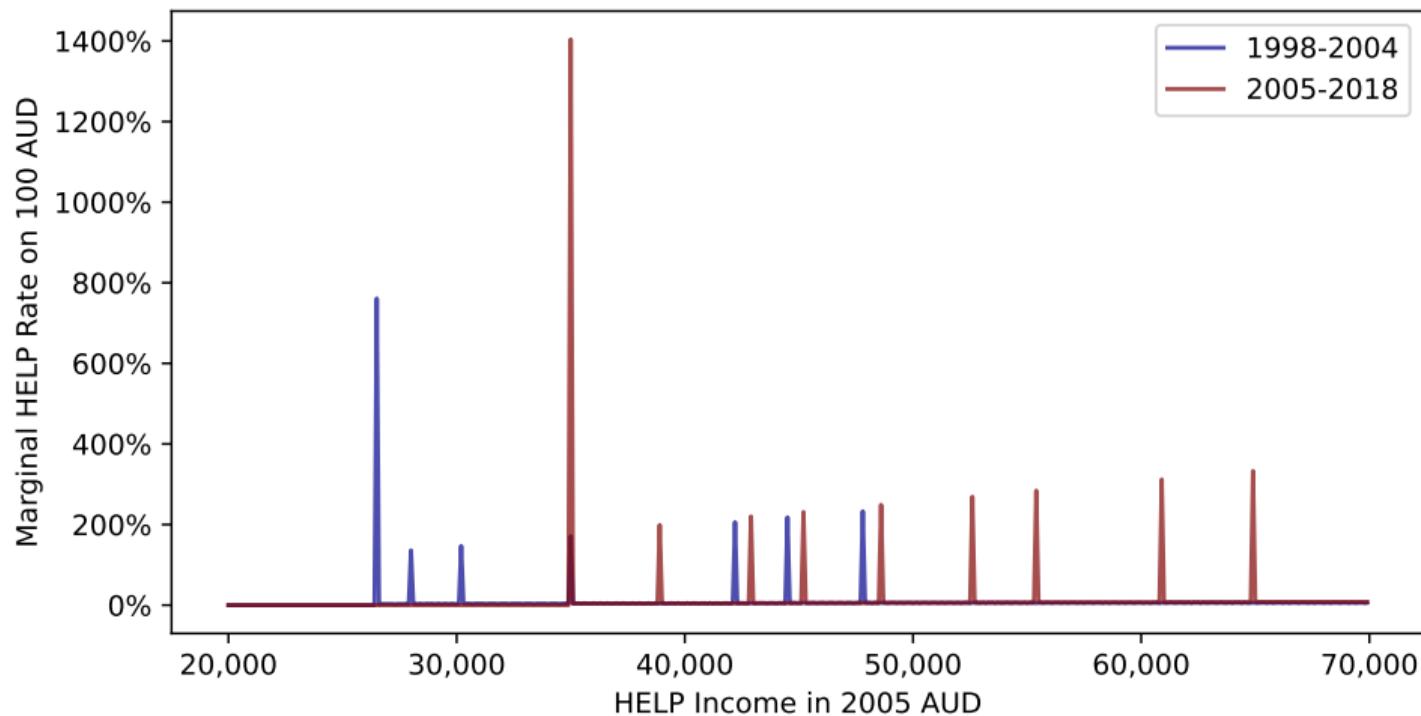

# DIFFERENCES BETWEEN AUSTRALIA AND US: STATISTICS

Feature of Environment	Australia	US
<b>Cost of Higher Education</b>		
Public Undergraduate Tuition Cost	\$2,700–\$10,100 USD per year for CSPs	\$9,500 USD per year for 4-Year In-State \$39,000 USD per year for 4-Year Private Nonprofit
Total Cost of Attendance	\$15,850 USD per year	\$22,700 USD per year
Prevalence of Scholarships	Rare	Common
Initial Student Debt Borrowed	\$8,100–\$30,300 USD	\$51,800 USD (Average)
<b>Student Population</b>		
% of Population with Undergraduate Degree	38%	32%
% of Undergraduates at Private Universities	6%	26%
% of Undergraduates from Abroad	16%	5%
% of Current Students Employed	50%	40%
<b>Income Distribution and Taxes/Transfers</b>		
Median Personal Income	\$33,500 USD	\$40,500 USD
Poverty Line for Single Individual	\$16,200 USD	\$14,580 USD
Gini Coefficient for Income	0.32	0.38
Marginal Tax Rate at Average Income	41%	41%
Heathcote et al. (2017) Tax Progressivity	0.133	0.184
1-Month Individual UI Replacement Rate	23%	35%
Union Membership Rate	13.7%	10.3%

## Ease HECS burden on students, say universities

Kate Marshall

Jan 9, 2003 – 11.00am

Save

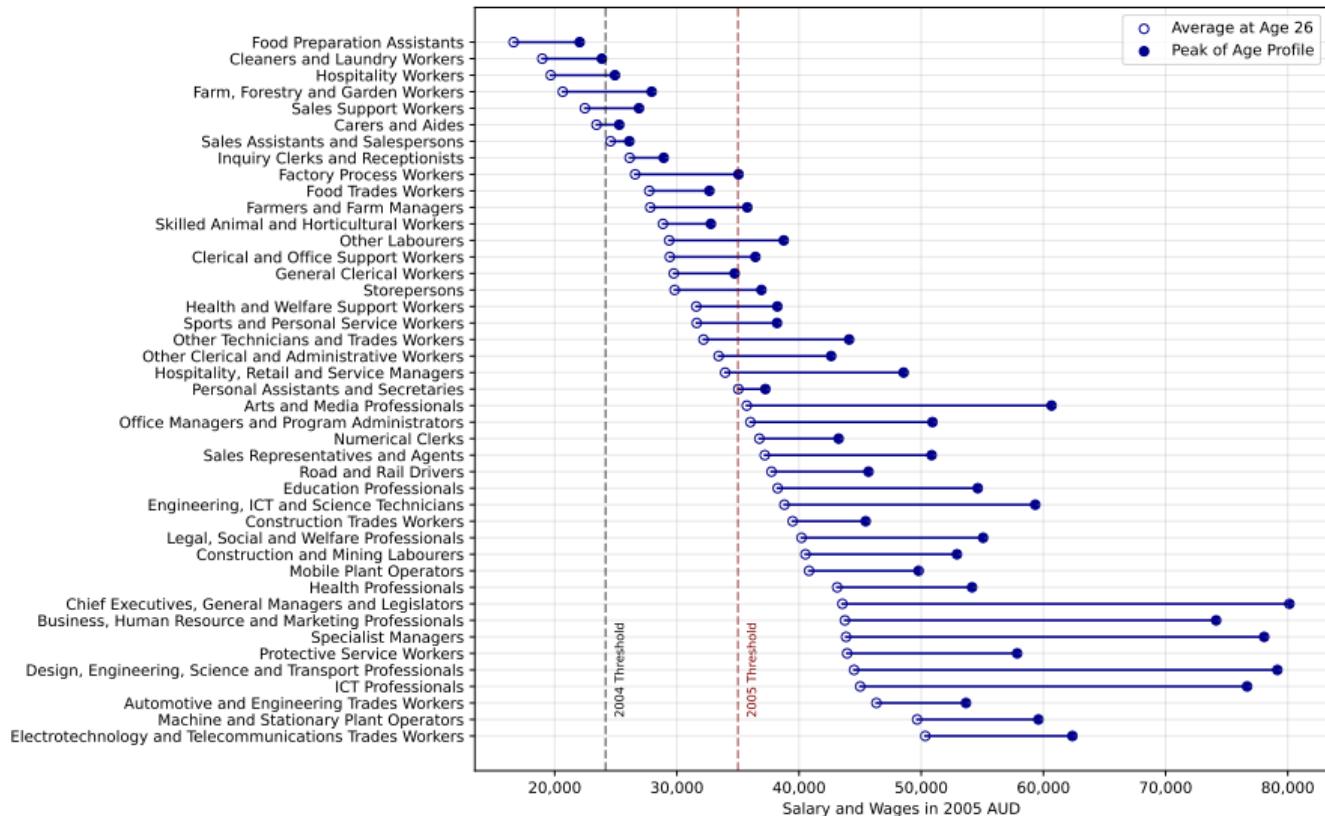

Share

Australian students owing more than \$9 billion of debts to the federal government should be spared financial heartache under a proposal to lift the income threshold for repayments, the Australian Vice-Chancellors Committee said yesterday.

## COMPUTATION OF BUNCHING STATISTIC

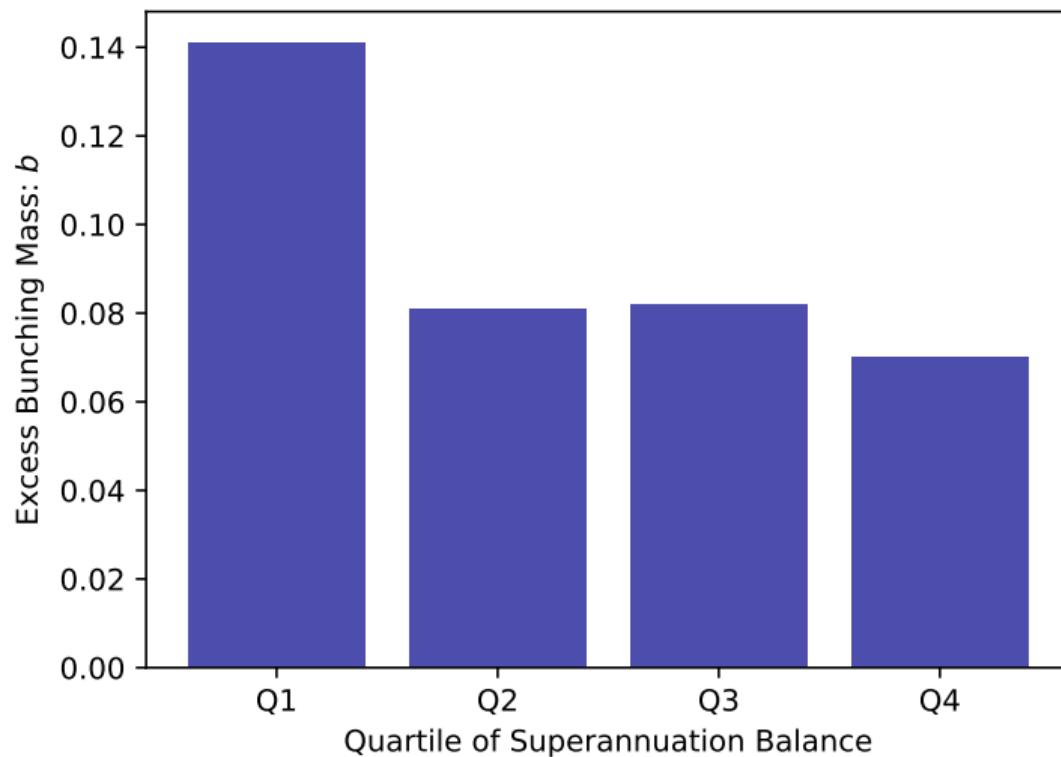

- Bunching statistic calculated as in prior literature Chetty et al. 2011, Kleven-Waseem 2013

- Fit 5-piece spline leaving out  $[\$32,500, \$35,000 + X]$   $\Rightarrow$  **counterfactual density**
- Iterate and choose  $X$  so that counterfactual density integrates to 1
- 

$$b = \frac{\text{observed mass in } [\$32,500, \$35,000]}{\text{counterfactual mass in } [\$32,500, \$35,000]} - 1$$

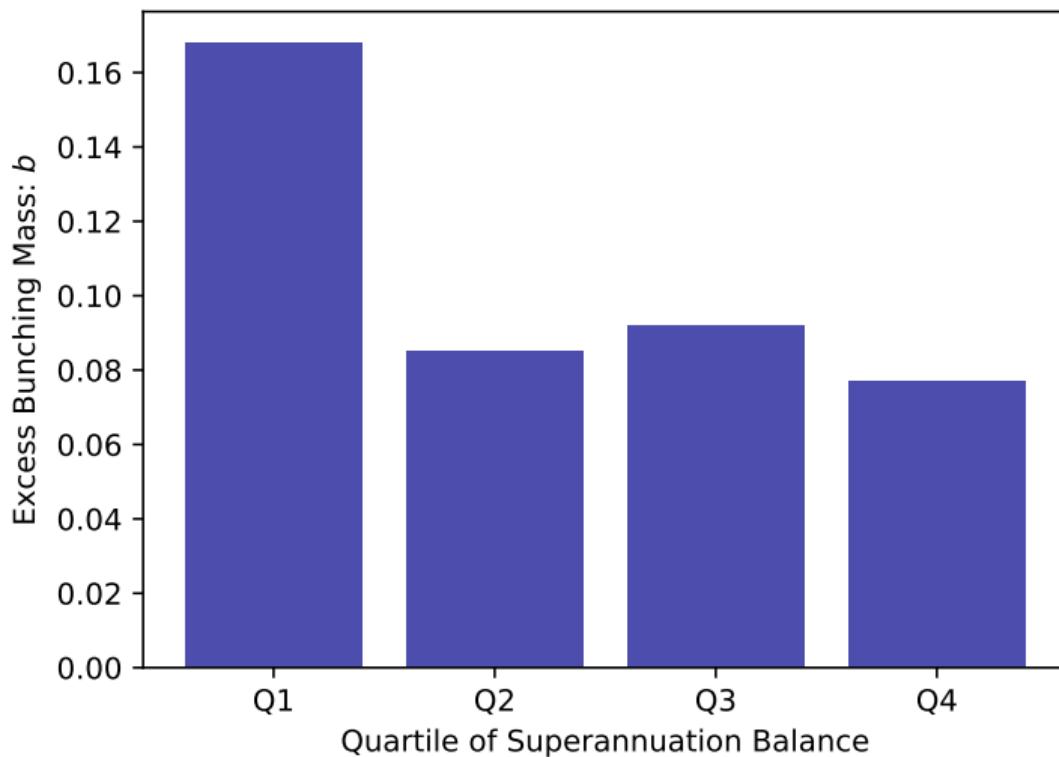

- $b = 0.1 \Rightarrow$  10% more people below threshold than would be absent discontinuity
  - Note: normalization makes  $b$  comparable across distributions of different shapes
- Sample:** All debtholders age 20 to 64 pooled across 2005 to 2018
  - Income deflated to 2005 so 0% threshold constant in real terms at **\$35,000**

# ADDITIONAL EMPIRICAL RESULTS

- ① **Persistence** of bunching below threshold lasts around three years 
- ② **Long-run**: income of “bunchers” similar to “non-bunchers” after two years 
- ③ No discontinuity in probability of **switching occupations** around threshold 
- ④ Limited heterogeneity in bunching with household **demographics** 
  - Caveat: no extensive margin responses, which can vary across groups Saez et al. 2012
- ⑤ Limited evidence of bunching coming from **firm responses** (as in Chetty et al. 2011) 
- ⑥ Additional tests for **evasion**:
  - Bunching present in **salary and wages**, which is harder to misreport Slemrod 2019 
  - Minimal difference in bunching based on **filing type** 
  - Bunching declines by only 4% when dropping **self-employed** 
  - Borrowers are median income ⇒ less avoidance **opportunities** Slemrod-Yitzhaki 2002

## COMPARISON WITH EXISTING LITERATURE ON LABOR SUPPLY (1/2)

Source: intensive-margin Hicks and Frisch elasticities reported in Keane (2011) and Chetty (2012)

## COMPARISON WITH EXISTING LITERATURE ON LABOR SUPPLY (2/2)

### Reasons why elasticity may be smaller:

- ① Different **sample**: college graduates with less flexibility and further from  $y_t = w_t l_t$
- ② Elasticity is **local** to threshold: no high-income individuals Gruber-Saez 2002
- ③ Bunching does not identify **extensive** margin responses Saez et al. 2012

### Contributions:

- ① **Empirical** characterization of responses to income-contingent repayment
  - $\ell_t$  of indebted households responds to liquidity not wealth, like  $c_t$  Ganong-Noel 2020
- ② **Dynamic** model of labor supply with time- and state-dependent adjustment
  - ✓ First paper (to my knowledge) to explicitly estimate different types of frictions

## MODEL FIT: OTHER TARGET MOMENTS

Estimation Target	Data	Model
Average Labor Income	\$42,639	\$45,582
Cross-Sectional Variance of Log Labor Income at Age 22	0.453	0.462
Cross-Sectional Variance of Log Labor Income at Age 32	0.555	0.491
Cross-Sectional Variance of Log Labor Income at Age 42	0.577	0.525
Cross-Sectional Variance of Log Labor Income at Age 52	0.539	0.580
Cross-Sectional Variance of Log Labor Income at Age 62	0.608	0.657
Linear Age Profile Term	0.077	0.080
Quadratic Age Profile Term	-0.001	-0.001
Education Income Premium Constant	-0.574	-0.554
Education Income Premium Slope	0.023	0.023
10th Percentile of 1-Year Labor Income Growth	-0.387	-0.392
10th Percentile of 5-Year Labor Income Growth	-0.667	-0.705
90th Percentile of 1-Year Labor Income Growth	0.415	0.393
90th Percentile of 5-Year Labor Income Growth	0.698	0.710
Average Labor Supply	1.000	0.963
Average Capital Income between Ages 40 and 44	\$1,338	\$1,332

◀ Back

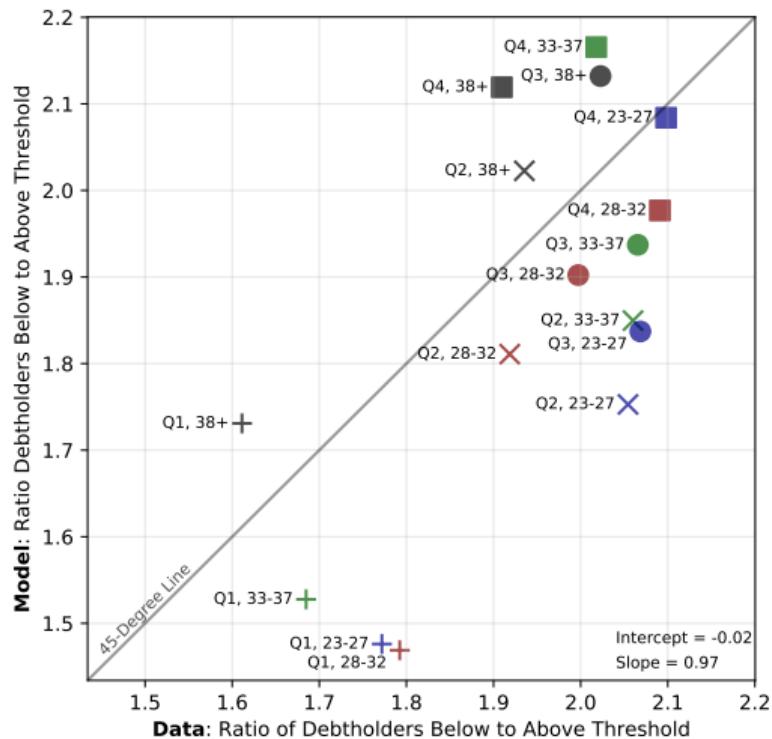

## ADDITIONAL MODEL RESULTS: POSITIVE

- ① **Robustness:**  $\hat{\phi} = 0.111$  with linear adjustment costs (vs. 0.114) 
- ② **Validation** of baseline model on nontargeted moments 
- ③ Bunching **decomposition**:  $P(\text{Repayment}) \approx 60\%$ , liquidity demands  $\approx 40\%$  
- ④ **Learning-by-doing**: cannot match heterogeneity in bunching by debt and age 

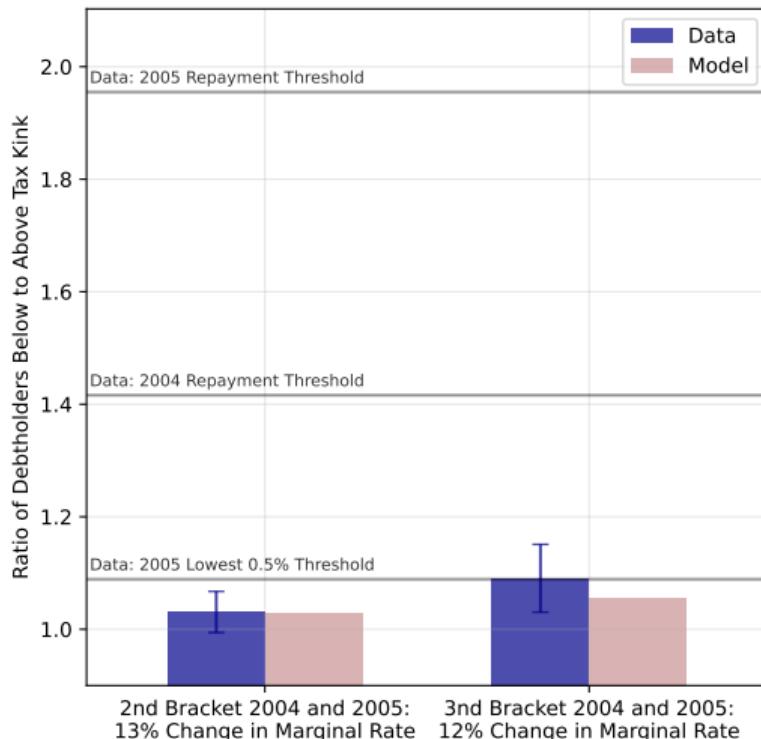

◀ Back

# DECOMPOSITION: RATE DIFFERENTIAL, REPAYMENT, AND LIQUIDITY

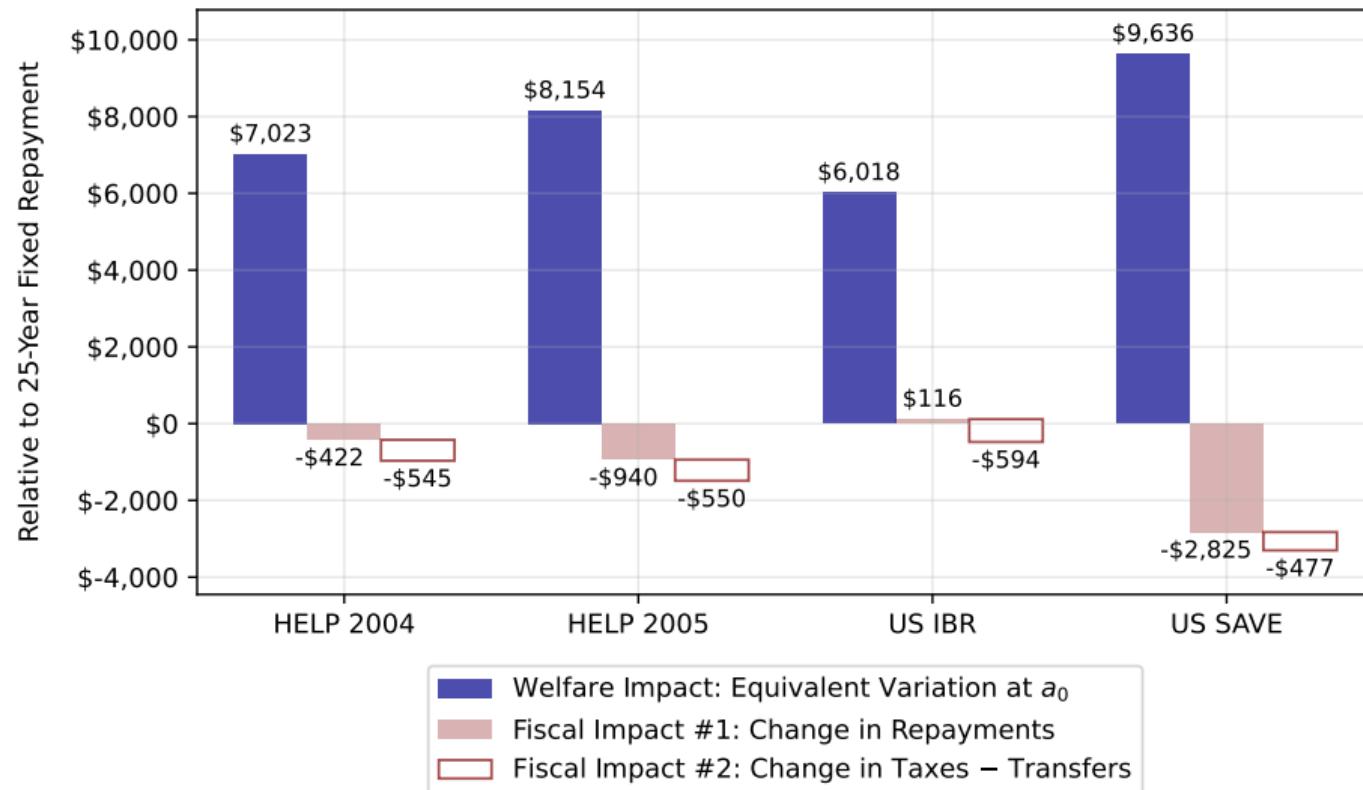

$$\text{Bunching Liquidity Gain} = \$1400 \geq \$1400 \times \frac{r + 1 - p}{1 + r} = \text{Bunching NPV Gain}$$

- Interest rate differential =  $r \Rightarrow 0\%$  of bunching
- Probability of repayment =  $p \Rightarrow 61\%$  of bunching
- Demand for liquidity  $\Rightarrow 39\%$  of bunching (Chetty 2008, Ganong-Noel 2023, Indarte 2023)

◀ Back: Additional Results

# ROBUSTNESS TO ALTERNATIVE MODELS OF FRICTIONS

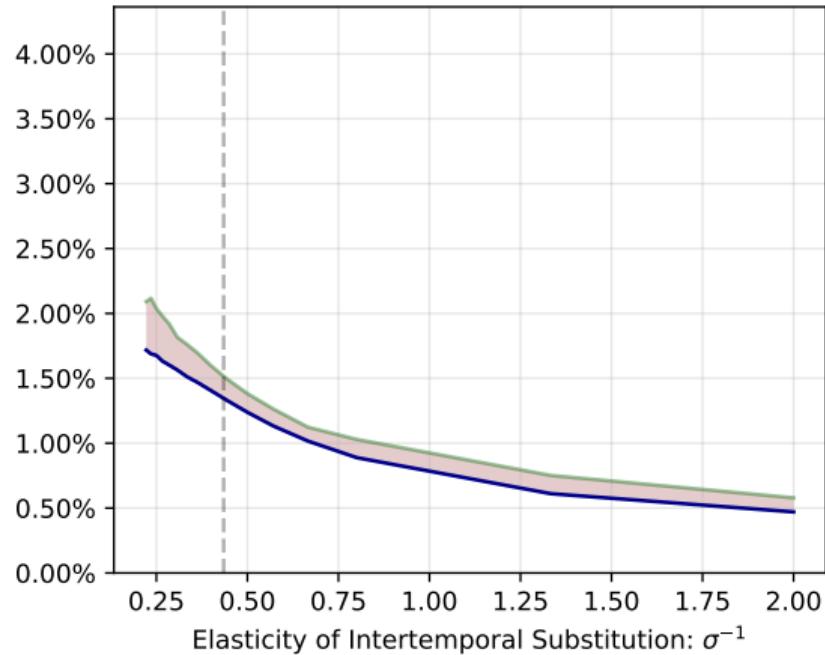

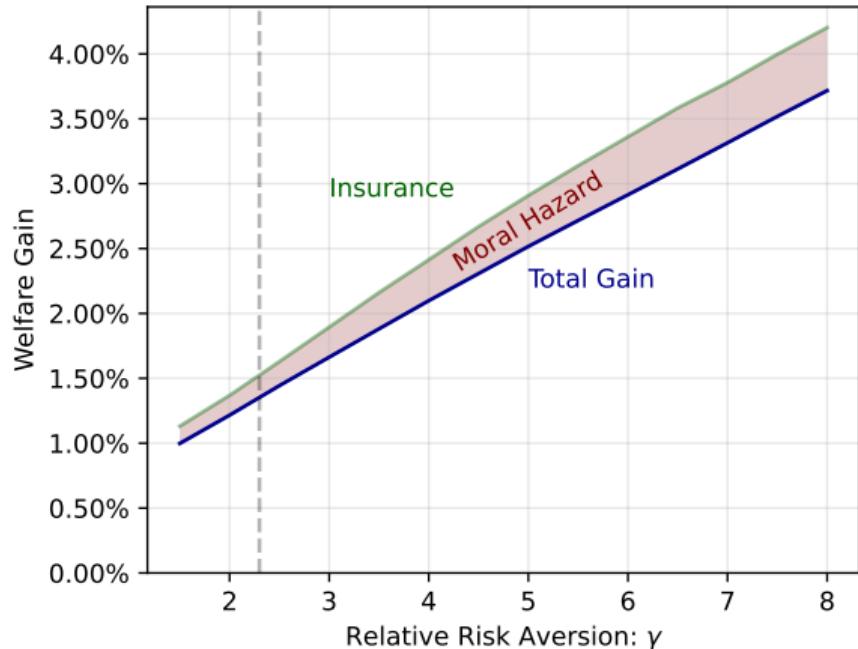

Difference from Baseline Model	Welfare Gain = Insurance	+ Moral Hazard	$\psi^*$	$K^*$
(1) $f = 0$	1.31%	1.61%	-0.3%	46% \$29,618
(2) $f = \$2278$	1.49%	1.65%	-0.16%	64% \$33,915
(3) $\lambda = 1$	1.27%	1.34%	-0.07%	38% \$28,191
(4) $\lambda = 0.147$	1.32%	1.47%	-0.15%	40% \$28,492
(5) Fixed Adjustment Cost Only	1.00%	1.49%	-0.49%	21% \$22,711
(6) Calvo Adjustment Only	2.02%	2.10%	-0.08%	64% \$46,452
(7) Linear Adjustment Cost	1.74%	1.87%	-0.13%	53% \$43,560
<b>Baseline Model</b>	<b>1.32%</b>	<b>1.47%</b>	<b>-0.15%</b>	<b>33% \$27,147</b>

- Loss from moral hazard is larger when adjustment is more **state**-dependent
- Larger gains with **linear** adjustment costs: more insurance and less moral hazard
