Disclaimer: The results of these studies are based, in part, on Australian Business Registrar (ABR) data supplied by the Registrar to the ABS under A New Tax System (Australian Business Number) Act 1999 and tax data supplied by the ATO to the ABS under the Taxation Administration Act 1953. These require that such data is only used for the purpose of carrying out functions of the ABS. No individual information collected under the Census and Statistics Act 1905 is provided back to the Registrar or ATO for administrative or regulatory purposes. Any discussion of data limitations or weaknesses is in the context of using the data for statistical purposes, and is not related to the ability of the data to support the ABR or ATO's core operational requirements. Legislative requirements to ensure privacy and secrecy of these data have been followed. Source data are de-identified and so data about specific individuals or firms has not been viewed in conducting this analysis. In accordance with the Census and Statistics Act 1905, results have been treated where necessary to ensure that they are not likely to enable identification of a particular person or organisation.

GOVERNMENT-FINANCED HIGHER EDUCATION

- Governments often provide subsidized financing for higher education
 - Student loans = \$1.6 trillion in US and 10% of household debt in US and UK

This Paper: Insurance vs. Moral Hazard		

Conditional on borrowing, how does income-contingent repayment affect **labor supply** and welfare?

① **Setting:** Australia's Higher Education Loan Program

- **Variation:** discontinuities in repayment rates + policy change to these rates
- **Identification:** limited room for selection and ex-ante responses

② **Research design:** bunching at discontinuities before and after policy change

- **Data:** universe of income tax returns + student debt balances

Conditional on borrowing, how does income-contingent repayment
affect labor supply and **welfare**?

- ① Setting: Australia's Higher Education Loan Program
- ② Research design: bunching at discontinuities before and after policy change
- ③ **Model**: life cycle model with endogenous labor supply + uninsurable wage risk
 - **Positive**: translate responses into estimates of preference parameters
 - **Normative**: characterize optimal amount of income-contingent repayment

- ① **Empirics:** borrowers adjust labor supply to ↓ income-contingent repayments
 - Larger responses in occupations with more hourly flexibility
 - Responses increase with liquidity constraints and decrease with **P**(repayment)
- ② **Structural estimation:** labor supply elasticity of **0.11** + adjustment frictions
- ③ **Contract design:** providing insurance with income-contingent loans ⇒ ↑ welfare
 - Moral hazard significantly reduces optimal amount of insurance
 - Fixed repayment → optimal income-contingent loan ⇒ ↑ **1.3%** lifetime consumption
 - Forbearance + fixed repayment does worse because of slower repayment

- ① **Empirics:** borrowers adjust labor supply to ↓ income-contingent repayments
 - Larger responses in occupations with more hourly flexibility
 - Responses increase with liquidity constraints and decrease with **P**(repayment)
- ② **Structural estimation:** labor supply elasticity of **0.11** + adjustment frictions
- ③ **Contract design:** providing insurance with income-contingent loans ⇒ ↑ welfare
 - Moral hazard significantly reduces optimal amount of insurance
 - Fixed repayment → optimal income-contingent loan ⇒ ↑ **1.3%** lifetime consumption
 - Forbearance + fixed repayment does worse because of slower repayment

Takeaway: income-contingent repayment creates **moral hazard** that affects contract design, but **too small** to justify fixed repayment

STUDENT LOANS IN AUSTRALIA: HELP

- Australian citizens eligible for government-provided student loans through **HELP**
- **Initial debt** = tuition – government contribution – upfront payment (average $\approx \$20K$ USD)
- Debt grows at CPI net of **income-contingent repayments**:

$$\text{Repayment}_{it} = \text{HELP Rate}_t (\text{HELP Income}_{it}) \times \text{HELP Income}_{it}$$

$$\text{HELP Income}_{it} = \text{Labor Income}_{it} + \text{Capital Income}_{it} - \text{Deductions}_{it}$$

- Repayments continue until remaining debt balance equals zero or death
 - ✗ Cannot be cancelled or discharged in bankruptcy
 - Note: collection done from individual (not household) tax returns

▶ Variable Definitions

WHY STUDY INCOME-CONTINGENT REPAYMENT IN AUSTRALIA?

- Benefit #1: only one government contract + no private market
 - Only choice is between borrowing and paying upfront; former **heavily** subsidized
 - ✓ Limited scope for **adverse selection** (or selection on moral hazard)
- Benefit #2: loans can only be used for tuition
 - Tuition is government-controlled at public universities (94% of enrollment)
 - ✓ Less room for **ex-ante** moral hazard from changes in borrowing
- Benefit #3: first nationwide provider of income-contingent loans in 1989
 - ✓ Borrowers likely **understand** structure of repayment

WHY STUDY INCOME-CONTINGENT REPAYMENT IN AUSTRALIA?

► Differences from US

- ① Universe of individual tax returns from ATO (~ US Form 1040)
- ② Administrative HELP data: debt balances and repayments
- ③ 2016 Household Census: self-reported hours and mortgage + rent payments
- ④ Administrative retirement savings data: superannuation balances
- ⑤ HILDA: survey data on hours worked and asset holdings

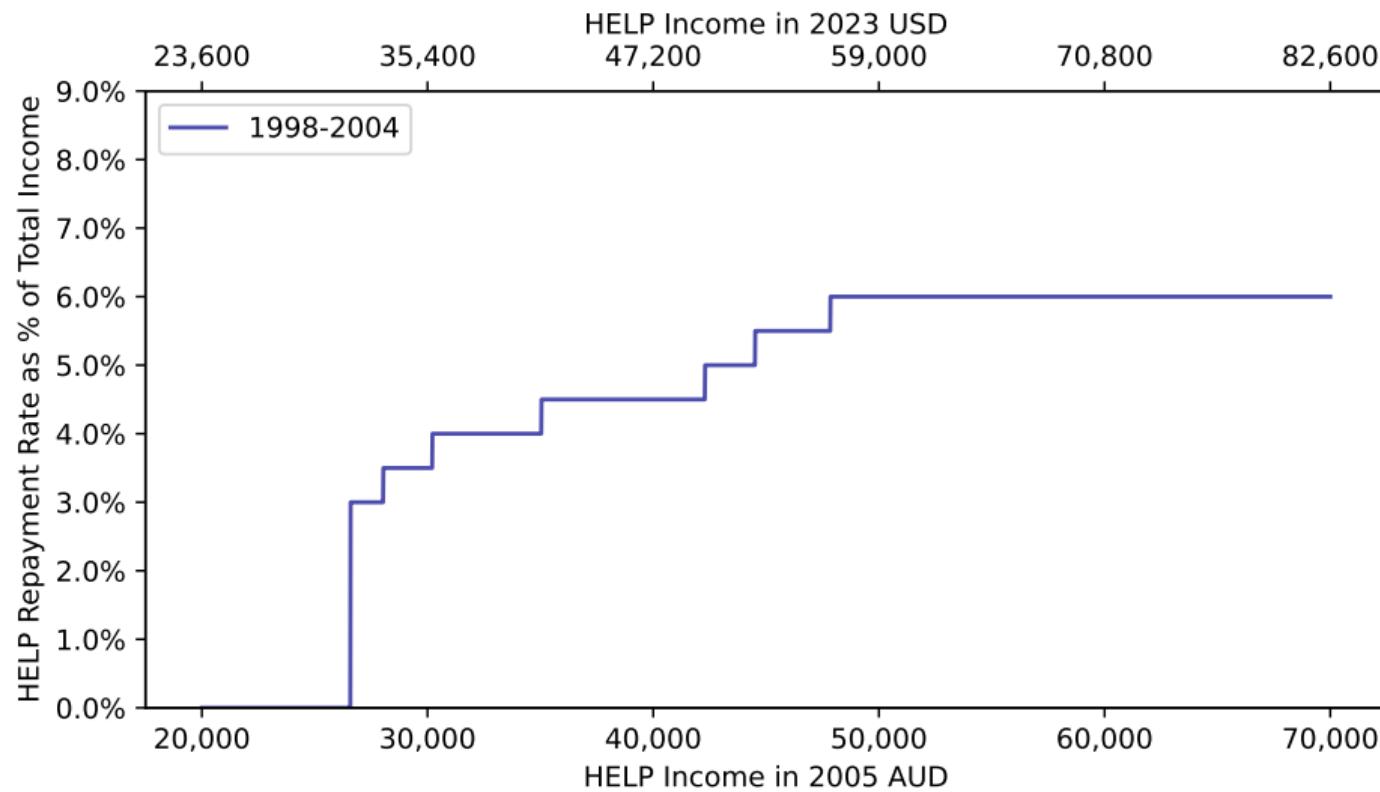

- ① Universe of individual tax returns from ATO (~ US Form 1040)
- ② Administrative HELP data: debt balances and repayments
- ③ 2016 Household Census: self-reported hours and mortgage + rent payments
- ④ Administrative retirement savings data: superannuation balances
- ⑤ HILDA: survey data on hours worked and asset holdings

Sample: ~ 4 million **unique** debtholders between ages 20-64 from 1991-2018

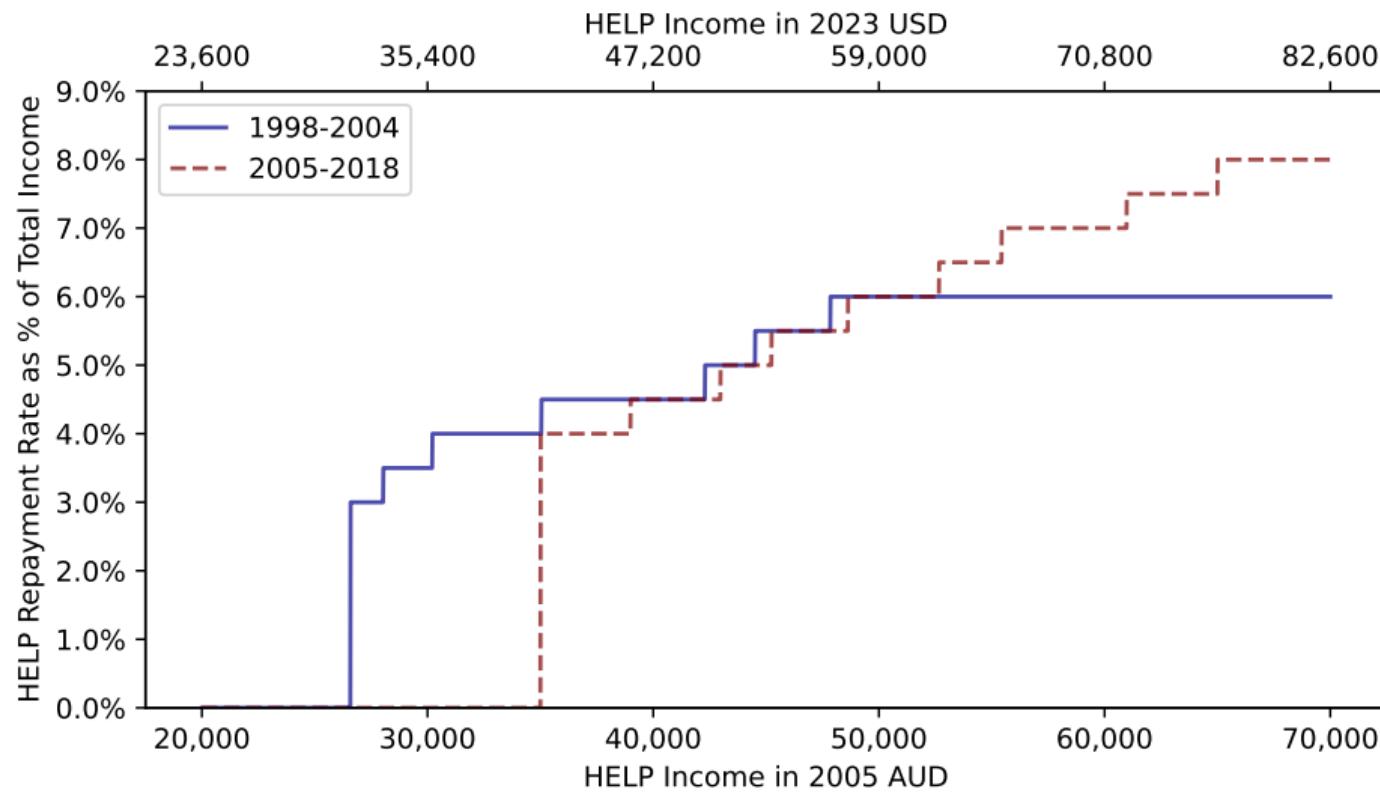

- Means at age 26: HELP Income = \$34K (98% labor income), debt = \$13K

Limitation: no information about borrowing (e.g., degree, institution)

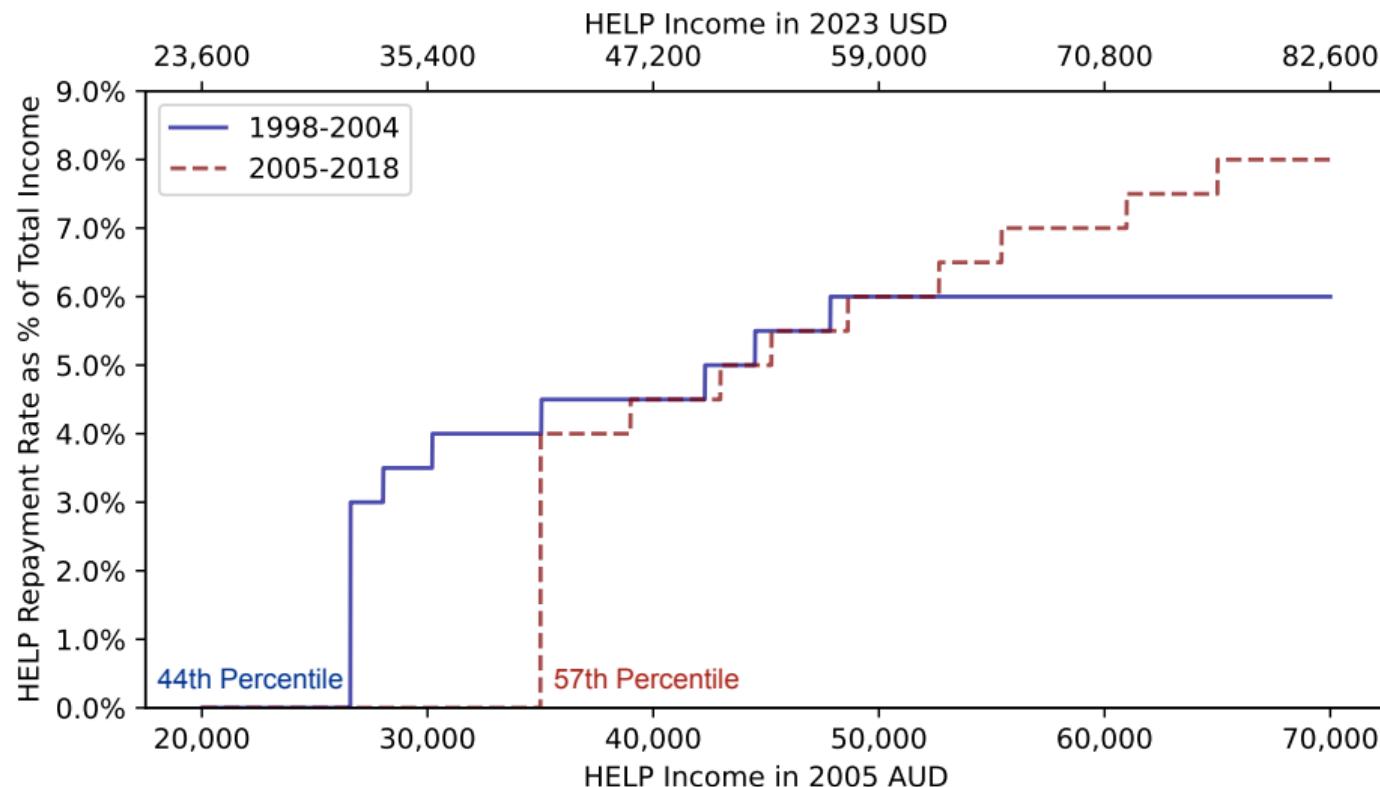

IDENTIFYING VARIATION: DISCONTINUITIES IN REPAYMENT RATES

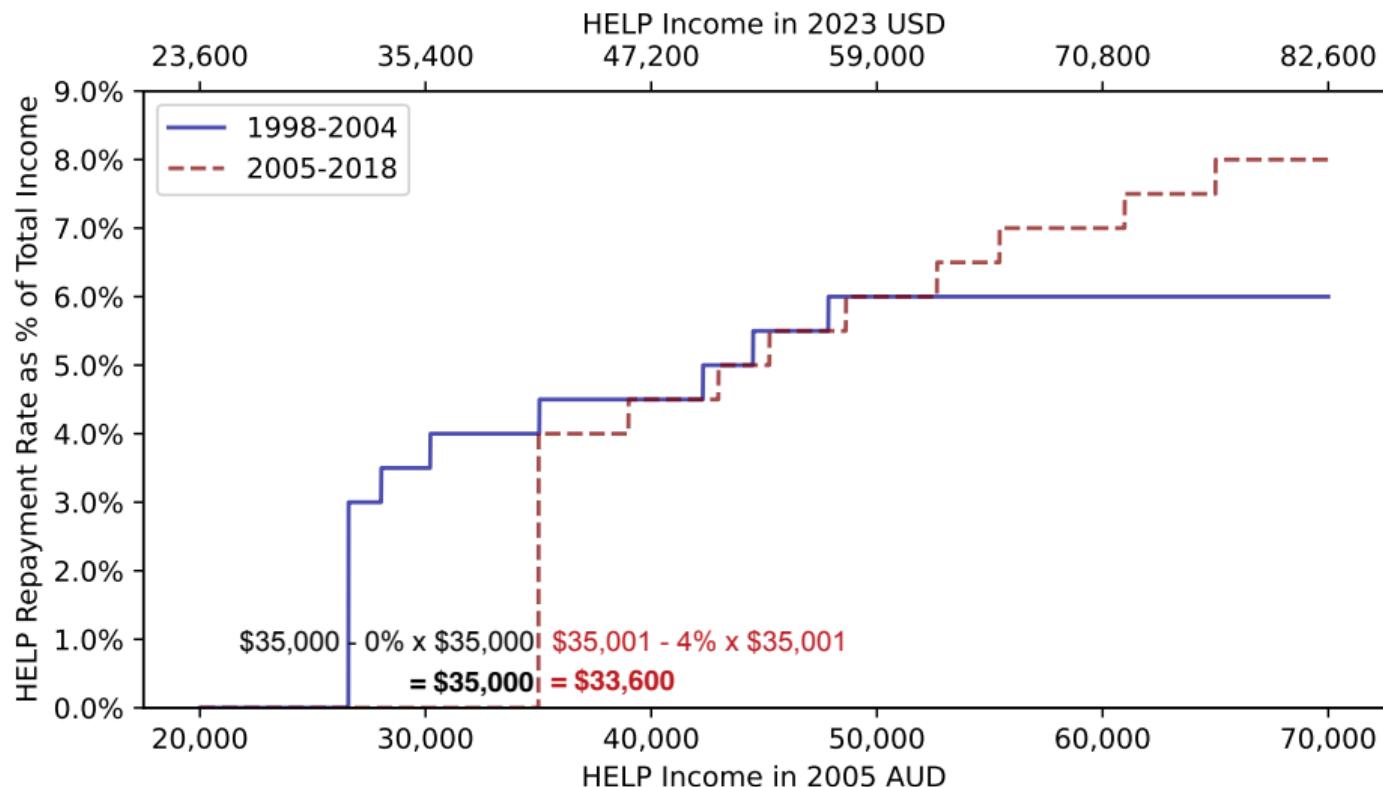

IDENTIFYING VARIATION: POLICY CHANGE TO REPAYMENT RATES

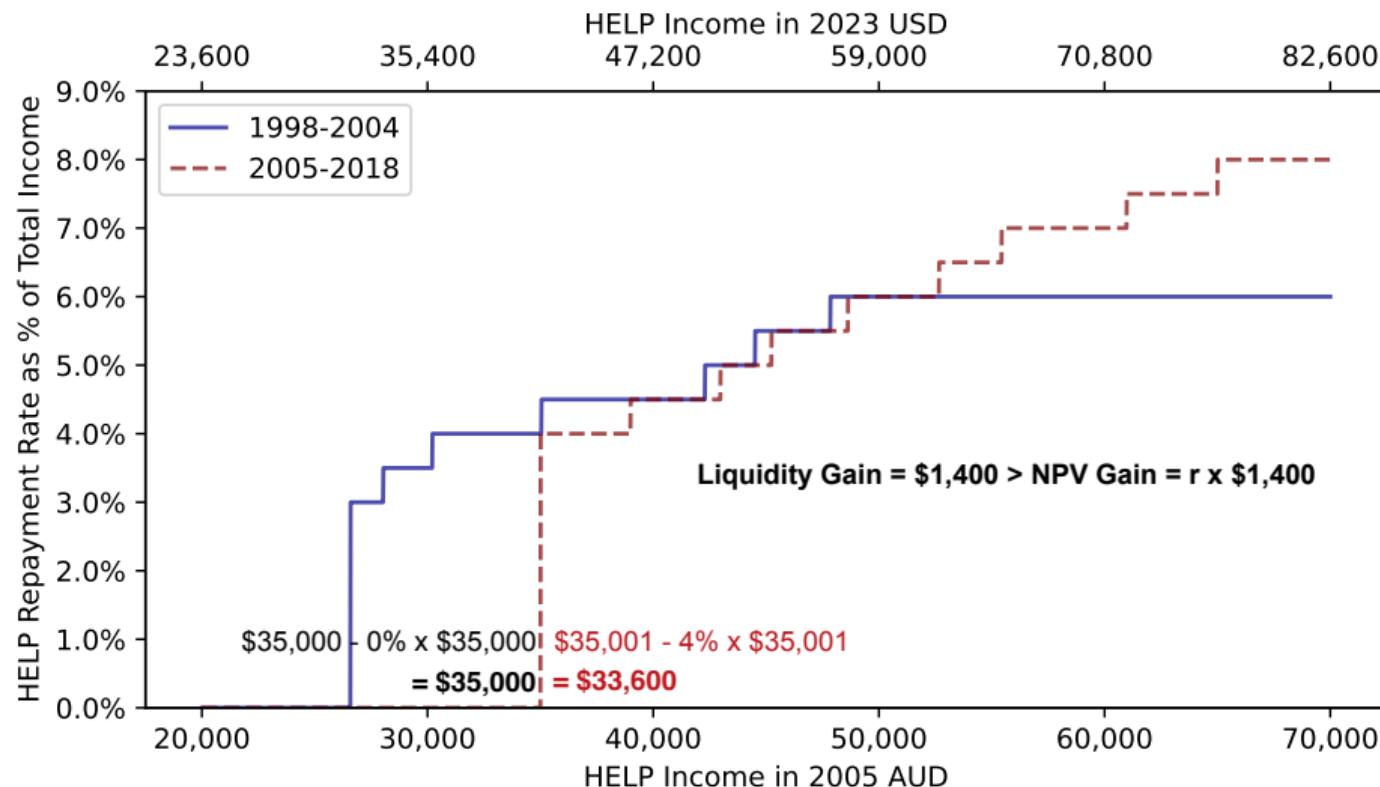

IDENTIFYING VARIATION: POLICY CHANGE TO REPAYMENT RATES

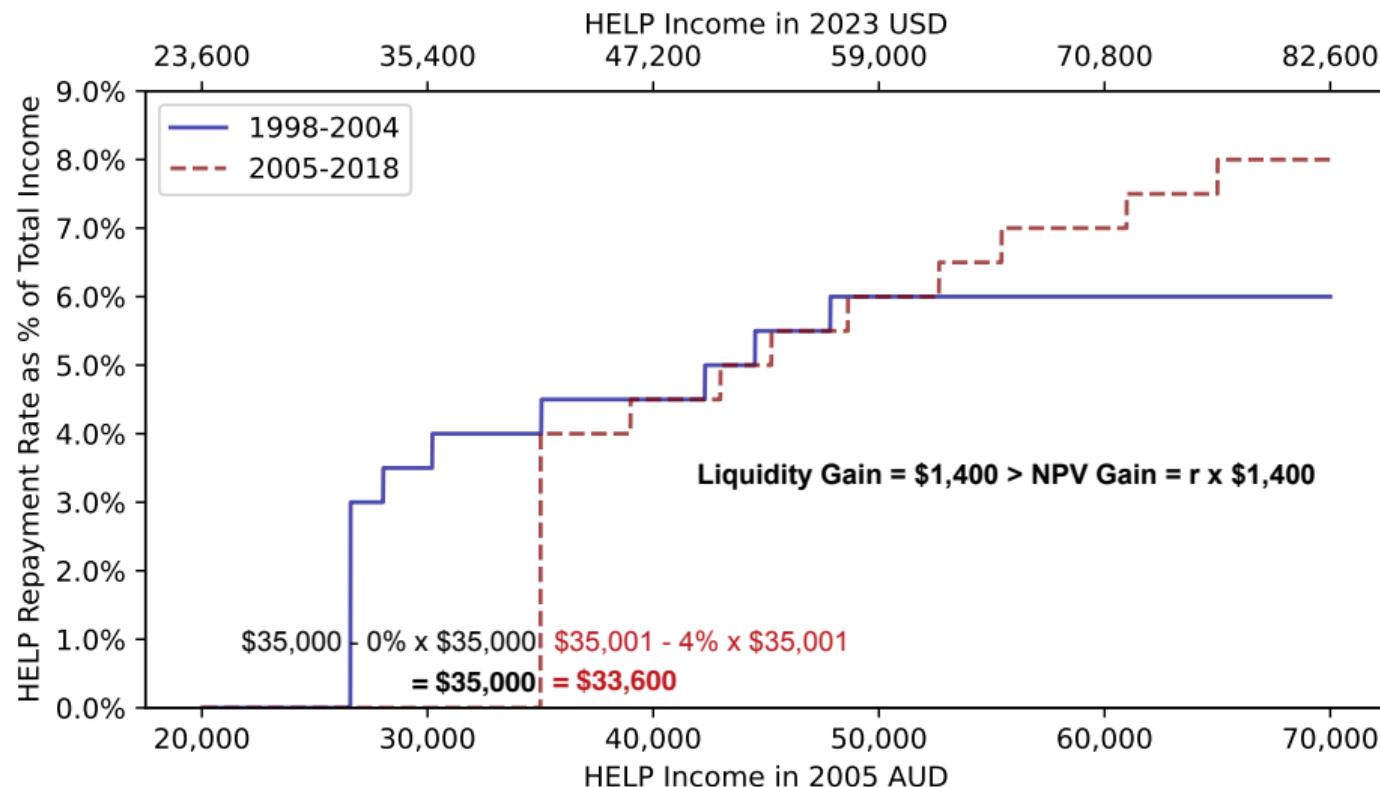

REPAYMENT THRESHOLD INCREASES AVERAGE REPAYMENT RATE

REPAYMENT THRESHOLD INCREASES LIQUIDITY MORE THAN WEALTH

REPAYMENT THRESHOLD INCREASES LIQUIDITY MORE THAN WEALTH

Note: policy change applied to new and existing debtholders

BUNCHING INCREASES WITH PROXIES FOR LIQUIDITY CONSTRAINTS

► Within Age ► House Prices

BUNCHING INCREASES WITH PROXIES FOR LIQUIDITY CONSTRAINTS

► Within Age ► House Prices

Facts about moral hazard:

► Additional Results

- ① Borrowers reduce labor income in response to income-contingent repayment
 - Reflects labor supply: “bunchers” work fewer hours and in more flexible occupations
- ② Size of responses depends on
 - Liquidity: increases with liquidity demands, decreases with retirement wealth
 - P(repayment): increases with debt, decreases with income growth and peak 
- ③ Limited evidence of future wage reductions from reducing labor supply 

Facts about moral hazard:

► Additional Results

- ① Borrowers reduce labor income in response to income-contingent repayment
 - Reflects labor supply: “bunchers” work fewer hours and in more flexible occupations
- ② Size of responses depends on
 - Liquidity: increases with liquidity demands, decreases with retirement wealth
 - P(repayment): increases with debt, decreases with income growth and peak 
- ③ Limited evidence of future wage reductions from reducing labor supply 

Questions for model:

- ① How large are these labor supply responses quantitatively?
- ② Do they imply the costs of income-contingent repayment exceed the benefits?

OUTLINE

- 1 Institutional Background and Data
- 2 Labor Supply Responses to Income-Contingent Repayment
- 3 Life Cycle Model with Endogenous Labor Supply
- 4 Welfare and Fiscal Impacts of Income-Contingent Repayment
- 5 Conclusion

MODEL DESCRIPTION

OVERVIEW

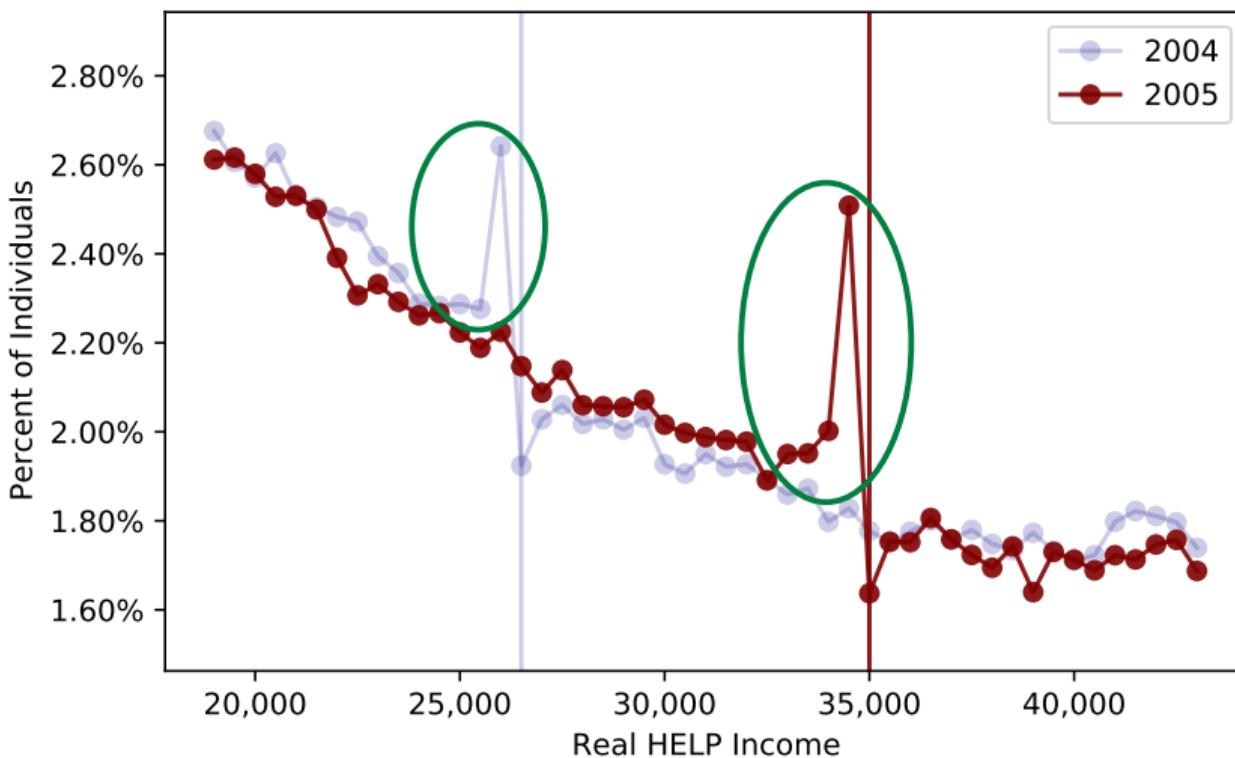

Life cycle model with debt + incomplete markets + endogenous labor supply

- Overlapping generations born at 22 with heterogeneous assets, wage, and debt
- From 22 to 64, individuals choose consumption, c_a , and labor supply, ℓ_a
 - Wage rate subject to idiosyncratic shocks (no agg. risk, partial eq.)
 - Shocks are **uninsurable**: borrowing allowed up to age-dependent limit with interest
- After age 64, individuals retire and choose consumption c_a

Life cycle model with debt + incomplete markets + endogenous labor supply

- Overlapping generations born at 22 with heterogeneous assets, wage, and debt
- From 22 to 64, individuals choose consumption, c_a , and labor supply, ℓ_a
 - Wage rate subject to idiosyncratic shocks (no agg. risk, partial eq.)
 - Shocks are **uninsurable**: borrowing allowed up to age-dependent limit with interest
- After age 64, individuals retire and choose consumption c_a
- **Government**
 - Revenues: progressive income taxes, debt repayments
 - Expenses: means-tested unemployment benefits & retirement pension, initial debt

BUNCHING CONSISTENT WITH POSITIVE LABOR SUPPLY ELASTICITY

MASS ABOVE THRESHOLD INCONSISTENT WITH FRICTIONLESS MODEL

- Moving above to below threshold \Rightarrow more leisure **and** \$1400 more cash-on-hand

LABOR SUPPLY OPTIMIZATION FRICTIONS

- Choice of ℓ_a subject to two **optimization frictions** to give mass above threshold
 - Similar to models of pricing Nakamura-Steinsson 2010 and refinancing Andersen et al. 2020
- ① Canonical model of **time**-dependent adjustment (Calvo):
 - Fraction λ hit by shock and adjust ℓ_a , other $1 - \lambda$ set $\ell_a = \ell_{a-1}$
 - E.g. inattention, arrival of opportunities to change hours/jobs
 - ② Canonical model of **state**-dependent adjustment (*sS*):
 - Individuals hit by **Calvo shock** incur utility cost f , if they choose $\ell_a \neq \ell_{a-1}$
 - E.g. real or psychological costs of changing hours/jobs

LABOR SUPPLY OPTIMIZATION FRICTIONS

- Choice of ℓ_a subject to two **optimization frictions** to give mass above threshold
 - Similar to models of pricing Nakamura-Steinsson 2010 and refinancing Andersen et al. 2020
- ① Canonical model of **time**-dependent adjustment (Calvo):

$$V_a(\mathbf{s}_a) = \max_{\substack{A_{a+1} \geq A_{a+1}, \\ \ell_a}} \left\{ \left[c_a - \kappa \frac{\ell_a^{1+\phi^{-1}}}{1 + \phi^{-1}} - f * \mathbf{1}_{\ell_a \neq \ell_{a-1}} \right]^{1-\sigma} + \beta \left[m_a \mathbf{E}_{\mathbf{a}} (V_{a+1}(\mathbf{s}_{a+1})^{1-\gamma}) \right]^{\frac{1-\sigma}{1-\gamma}} \right\}^{\frac{1}{1-\sigma}}$$

$$c_a + A_{a+1} + d(y_a, D_a, t) + \tau(y_a) = y_a + A_a R$$

$$y_a = \ell_a w_a, \quad \log w_a = g_a + \theta_a + \epsilon_a$$

$$\mathbf{s}_a = (a \quad t \quad A_a \quad D_a \quad \theta_a \quad \epsilon_a \quad \ell_{a-1} \quad \omega_a)$$

- θ_a = permanent income = $\rho \theta_{a-1} + \nu_a + \alpha \log \ell_{a-1}$ $\nu_a \sim N(0, \sigma_\nu^2)$
- ϵ_a = transitory shock $\sim N(0, \sigma_\epsilon^2)$ Extension: learning-by-doing

OPTIMIZATION PROBLEM OF INDIVIDUALS HIT BY CALVO SHOCK

$$V_a(\mathbf{s}_a) = \max_{\substack{A_{a+1} \geq A_{a+1}, \\ \ell_a}} \left\{ \left[c_a - \kappa \frac{\ell_a^{1+\phi^{-1}}}{1 + \phi^{-1}} - f * \mathbf{1}_{\ell_a \neq \ell_{a-1}} \right]^{1-\sigma} + \beta \left[m_a \mathbf{E}_{\mathbf{a}} (V_{a+1}(\mathbf{s}_{a+1})^{1-\gamma}) \right]^{\frac{1-\sigma}{1-\gamma}} \right\}^{\frac{1}{1-\sigma}}$$

$$c_a + A_{a+1} + d(y_a, D_a, t) + \tau(y_a) = y_a + A_a R$$

$$y_a = \ell_a w_a, \quad \log w_a = g_a + \theta_a + \epsilon_a$$

$$\mathbf{s}_a = (a \quad t \quad A_a \quad D_a \quad \theta_a \quad \epsilon_a \quad \ell_{a-1} \quad \omega_a)$$

- ℓ_{a-1} = labor supply from previous period
- ω_a = Calvo shock that determines whether ℓ_a can be adjusted \sim Bernoulli(λ)

OPTIMIZATION PROBLEM OF INDIVIDUALS HIT BY CALVO SHOCK

$$V_a(\mathbf{s}_a) = \max_{\substack{A_{a+1} \geq A_{a+1}, \\ \ell_a}} \left\{ \left[c_a - \kappa \frac{\ell_a^{1+\phi^{-1}}}{1 + \phi^{-1}} - f * \mathbf{1}_{\ell_a \neq \ell_{a-1}} \right]^{1-\sigma} + \beta \left[m_a \mathbf{E}_{\mathbf{a}} (V_{a+1}(\mathbf{s}_{a+1})^{1-\gamma}) \right]^{\frac{1-\sigma}{1-\gamma}} \right\}^{\frac{1}{1-\sigma}}$$

$$c_a + A_{a+1} + d(y_a, D_a, t) + \tau(y_a) = y_a + A_a R$$

$$y_a = \ell_a w_a, \quad \log w_a = g_a + \theta_a + \epsilon_a$$

$$\mathbf{s}_a = (a \quad t \quad A_a \quad D_a \quad \theta_a \quad \epsilon_a \quad \ell_{a-1} \quad \omega_a)$$

- Sources of ex-ante heterogeneity:
 - θ_0 = initial permanent income $\sim N(0, \sigma_i^2)$
 - D_0 = initial debt, A_0 = initial assets

ESTIMATION

- **Interest rates and borrowing:**
 - Interest rate = 1.84%, borrowing rate = CC rate, debt interest rate = 0%
 - Borrowing limit = average CC limit by age
- **Demographics:** cohort birth rates and mortality risk taken from life tables
 - Consumption adjusted for equivalence scale using HH size (Lusardi et al. 2017)
- **Government:** use exact (non-smooth) formulas provided by ATO
- **Initial conditions:** assets and debt distributions taken from data at age 22
- **Baseline RRA and EIS:** $\gamma = \frac{1}{\sigma} = 2.23$ (Choukhmane-de Silva 2023)
 - Welfare analysis: consider alternative values + preference for early resolution

- **Interest rates and borrowing:**
 - Interest rate = 1.84%, borrowing rate = CC rate, debt interest rate = 0%
 - Borrowing limit = average CC limit by age
- **Demographics:** cohort birth rates and mortality risk taken from life tables
 - Consumption adjusted for equivalence scale using HH size (Lusardi et al. 2017)
- **Government:** use exact (non-smooth) formulas provided by ATO
- **Initial conditions:** assets and debt distributions taken from data at age 22
- **Baseline RRA and EIS:** $\gamma = \frac{1}{\sigma} = 2.23$ (Choukhmane-de Silva 2023)
 - Welfare analysis: consider alternative values + preference for early resolution
- **Learning-by-doing extension:** $\alpha = 0.24$ (median value from Best-Kleven 2013)

SECOND-STAGE SIMULATED METHOD OF MOMENTS

$$\text{Parameters} = \begin{pmatrix} & \\ & \end{pmatrix}$$

- **Estimation** via SMM with 47 moments + 14 parameters
 - Find parameters that minimize % difference between data & model moments
 - **Simulated policy change:** unanticipated change in HELP formula at $t = 2005$

SECOND-STAGE SIMULATED METHOD OF MOMENTS: IDENTIFICATION

$$\text{Parameters} = \left(\begin{array}{c} \overbrace{\phi \ f \ \lambda}^{\text{labor supply}} \\ \end{array} \right)$$

- **Labor supply elasticity:** identified by bunching below repayment threshold
- **Frictions:** identified by mass above repayment threshold

SECOND-STAGE SIMULATED METHOD OF MOMENTS: IDENTIFICATION

$$\text{Parameters} = \begin{pmatrix} \text{labor supply} \\ \phi \ f \ \lambda \end{pmatrix}$$

- **Labor supply elasticity:** identified by bunching below repayment threshold
- **Frictions:** identified by mass above repayment threshold
- Separate identification of **frictions**
 - Moments: heterogeneity in bunching with **debt**, bunching at **0.5%** threshold
 - **Intuition:** with $f = 0$, decision to bunch depends on Calvo shock not incentives

SECOND-STAGE SIMULATED METHOD OF MOMENTS: IDENTIFICATION

$$\text{Parameters} = \left(\underbrace{\phi, f, \lambda}_{\text{preferences}} \quad \underbrace{\kappa, \beta}_{\text{labor supply}} \quad \underbrace{\delta_0, \delta_1, \delta_2}_{\text{wage profile}} \quad \underbrace{\delta_0^E, \delta_1^E}_{\text{wage profile}} \quad \underbrace{\rho, \sigma_\nu, \sigma_\epsilon, \sigma_i}_{\text{wage risk}} \right)$$

- **Labor supply elasticity**: identified by bunching below repayment threshold
- **Frictions**: identified by mass above repayment threshold
- Separate identification of **frictions**
 - Moments: heterogeneity in bunching with **debt**, bunching at **0.5%** threshold
 - **Intuition**: with $f = 0$, decision to bunch depends on Calvo shock not incentives
- Note: wage profile & risk cannot be estimated separately in first-stage

OUTLINE

- 1 Institutional Background and Data
- 2 Labor Supply Responses to Income-Contingent Repayment
- 3 Life Cycle Model with Endogenous Labor Supply
- 4 Welfare and Fiscal Impacts of Income-Contingent Repayment
- 5 Conclusion

What repayment contract best balances **insurance** with **moral hazard**?

- Consider social planner that maximizes borrower welfare with **one** contract
 - Problem faced by governments with one contract (e.g., Australia, UK)
 - Contract is subsidized with zero interest rate, borrowing & prices held fixed

What repayment contract best balances **insurance** with **moral hazard**?

- Consider social planner that maximizes borrower welfare with **one** contract
 - Problem faced by governments with one contract (e.g., Australia, UK)
 - Contract is subsidized with zero interest rate, borrowing & prices held fixed
- **Step 1: existing** income-contingent loans vs. fixed repayment (not budget-neutral)
 - Four contracts: HELP 2004, HELP 2005, US Old & New IBR = $\psi * \max\{y - K, 0\}$
- **Step 2: optimal** income-contingent contracts vs. fixed repayment (budget-neutral)

What repayment contract best balances **insurance** with **moral hazard**?

- Consider social planner that maximizes borrower welfare with **one** contract
 - Problem faced by governments with one contract (e.g., Australia, UK)
 - Contract is subsidized with zero interest rate, borrowing & prices held fixed
- **Step 1: existing** income-contingent loans vs. fixed repayment (not budget-neutral)
 - Four contracts: HELP 2004, HELP 2005, US Old & New IBR = $\psi * \max\{y - K, 0\}$
- **Step 2: optimal** income-contingent contracts vs. fixed repayment (budget-neutral)
- Note: consider effect of forgiveness in Step 2

GOVERNMENT BUDGET = EXPECTED DISCOUNTED VALUE OF PAYMENTS

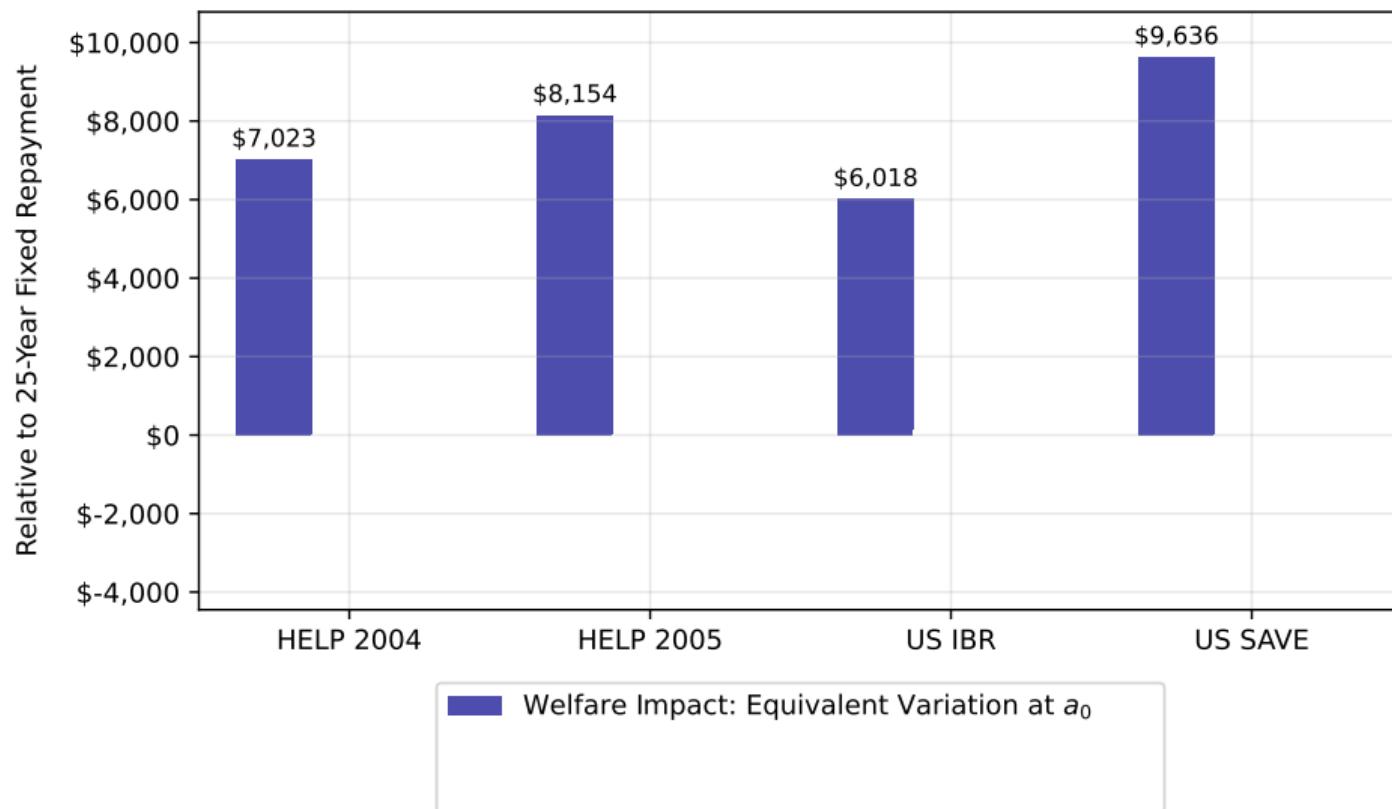

- **Government budget** defined as:

$$\mathcal{G} = \mathbf{E}_0 \sum_{a=a_0}^{a_T} \frac{\text{Repayments}_a + \text{Taxes}_a - \text{Transfers}_a}{\mathcal{R}_a}$$

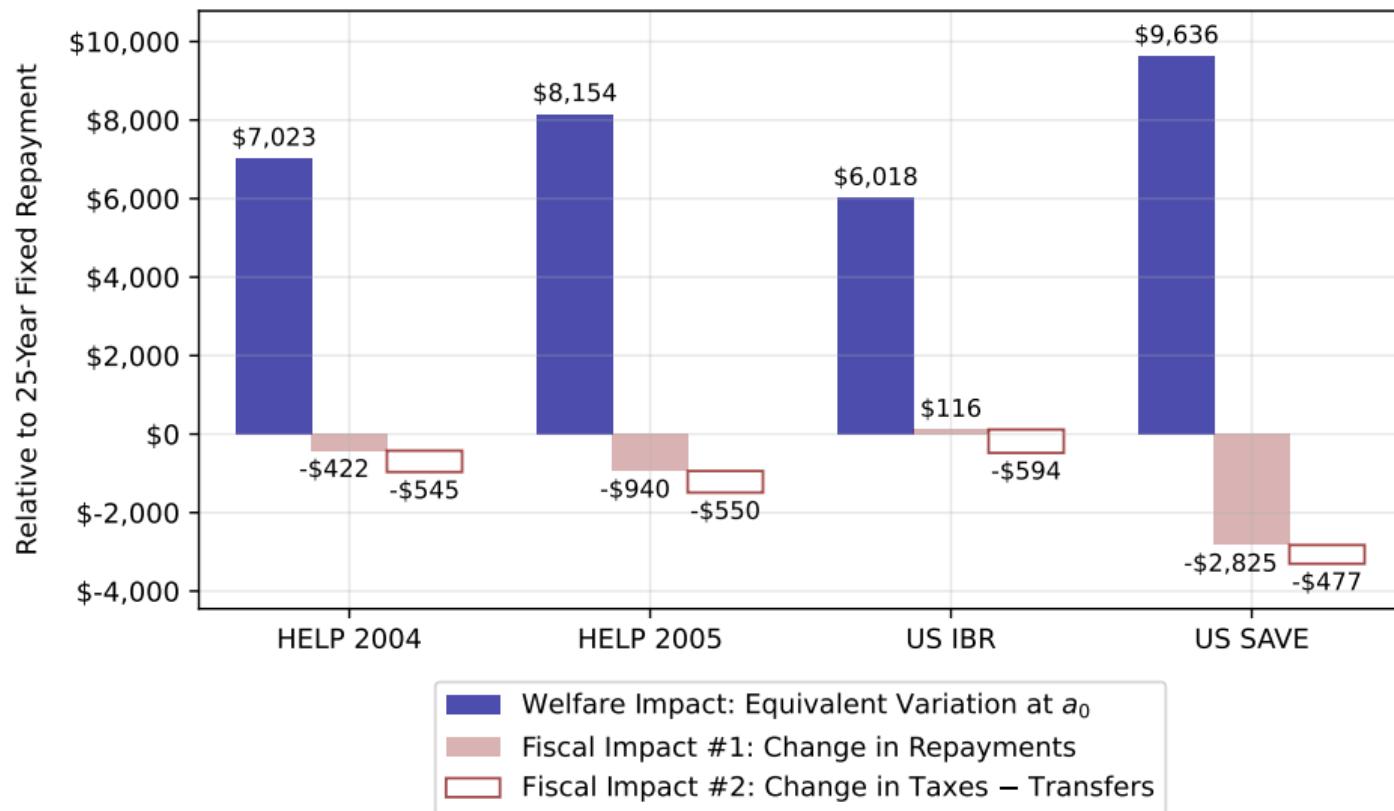

$$\mathcal{R}_a = \underbrace{\beta^{-(a-a_0)}}_{\text{individual time preference}} * \underbrace{\prod_{s=0}^{a-a_0} m_s}_{\text{mortality}}$$

- **Benchmark:** 25-Year Fixed Repayment = similar duration, not income-contingent
- Robustness with \mathcal{R}_a = risk-free rate & \mathcal{R}_a = risk-free rate + 4%

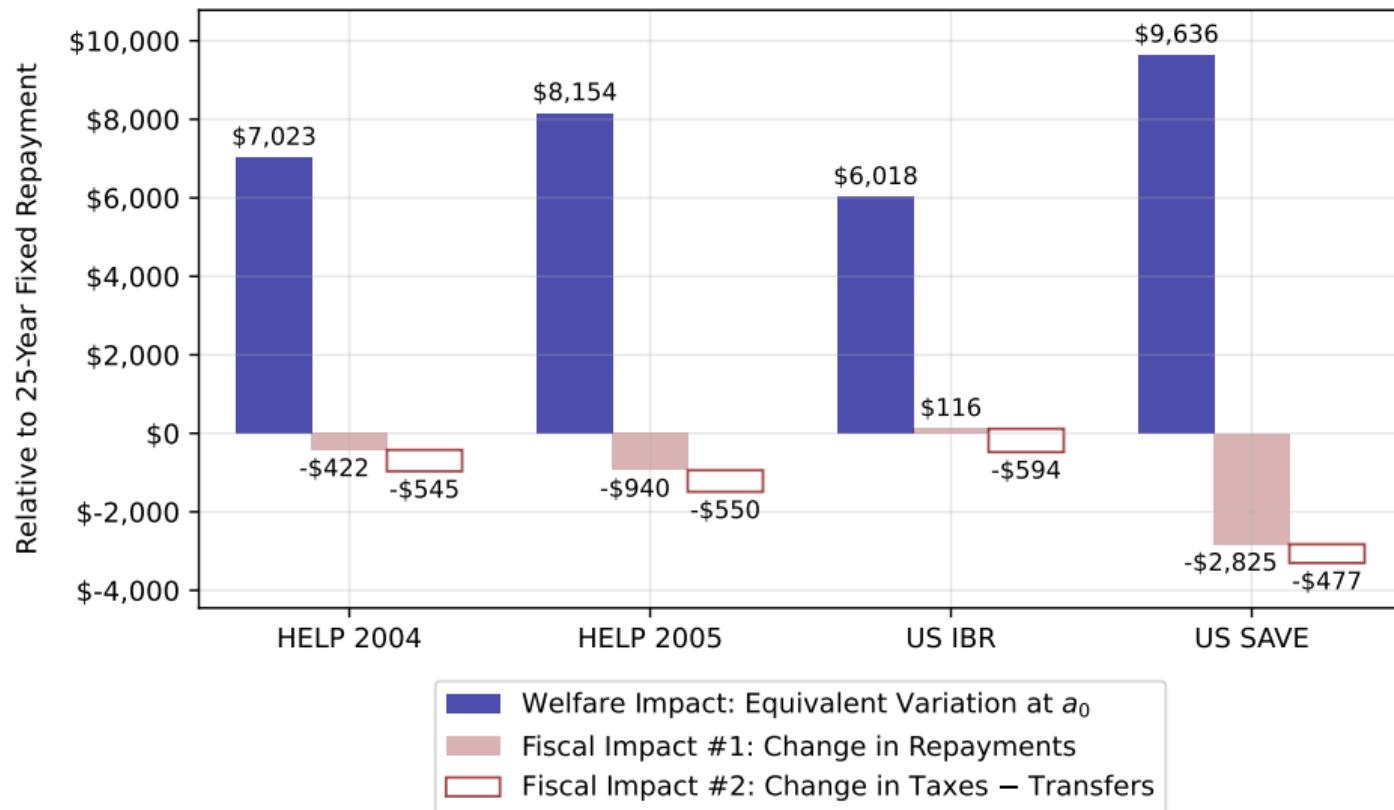

EXISTING INCOME-CONTINGENT LOANS VS. FIXED REPAYMENT

EXISTING INCOME-CONTINGENT LOANS VS. FIXED REPAYMENT

EXISTING INCOME-CONTINGENT LOANS VS. FIXED REPAYMENT

► Decomposition

► MVPF

CONSTRAINED-OPTIMAL INCOME-CONTINGENT LOANS

- Contracts have different fiscal costs \Rightarrow need to balance government budget
- **Next:** solve **constrained**-planner's problem to construct contracts with **same cost**

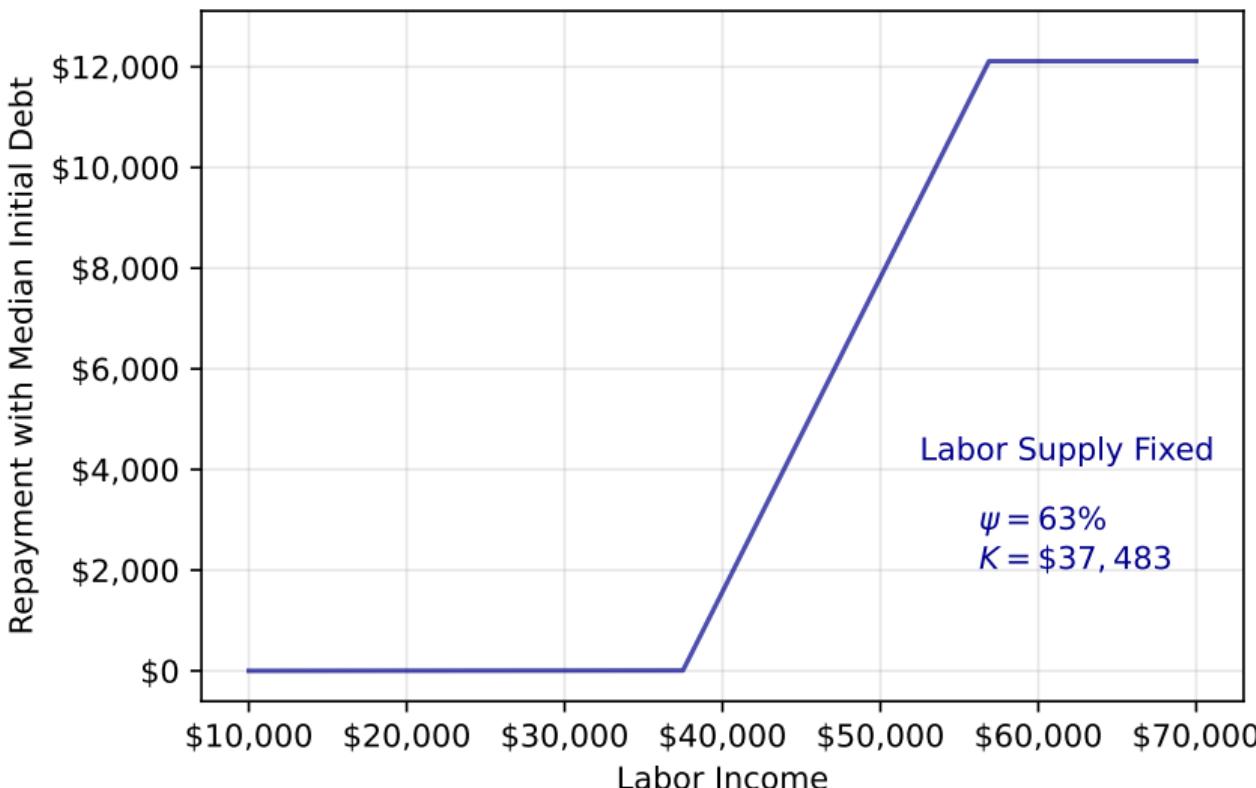

$$\max_{\psi, K} \mathbf{E}_0 \left(V_{a_0}^{1-\gamma} \right)^{\frac{1}{1-\gamma}}$$

subject to:

$$\mathbf{E}_0 \sum_{a=a_0}^{a_T} \frac{\text{Repayments}_a + \text{Taxes}_a - \text{Transfers}_a}{\mathcal{R}_a} \geq \mathcal{G}_{\text{25-Year Fixed}} \quad (1)$$

$$\text{Repayments}_a = \min \{ \psi * \max \{ y_a - K, 0 \}, D_a \} \quad (2)$$

SOLUTION TO CONSTRAINED-PLANNER'S PROBLEM

▶ Smooth

▶ vs. Existing

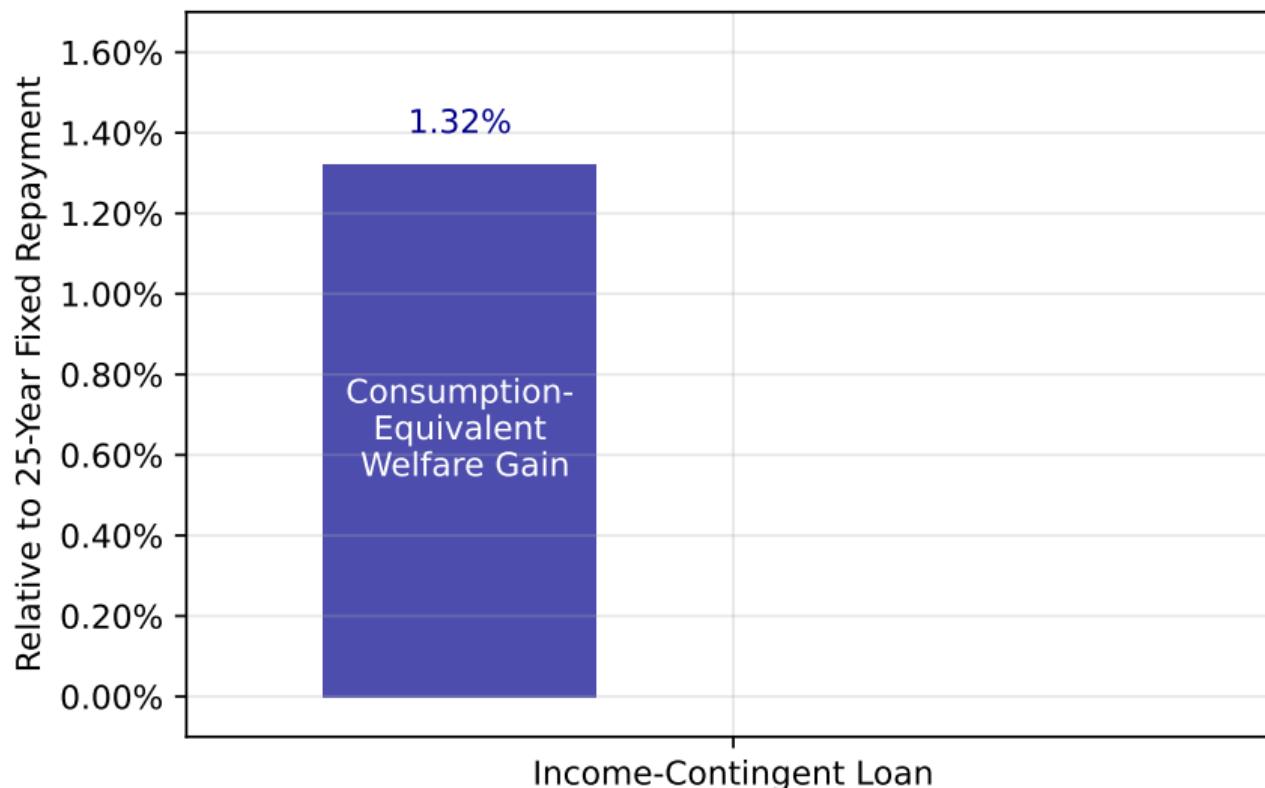

SOLUTION TO CONSTRAINED-PLANNER'S PROBLEM

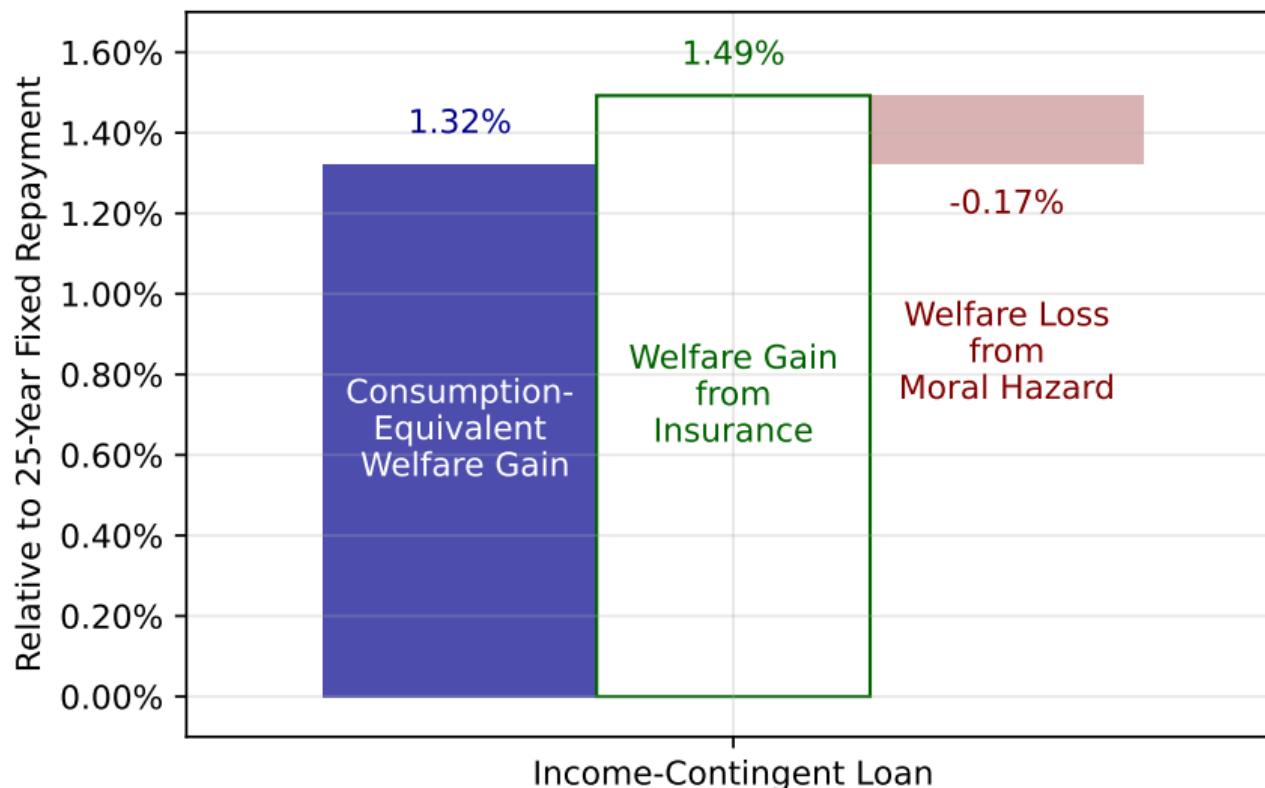

▶ Smooth

▶ vs. Existing

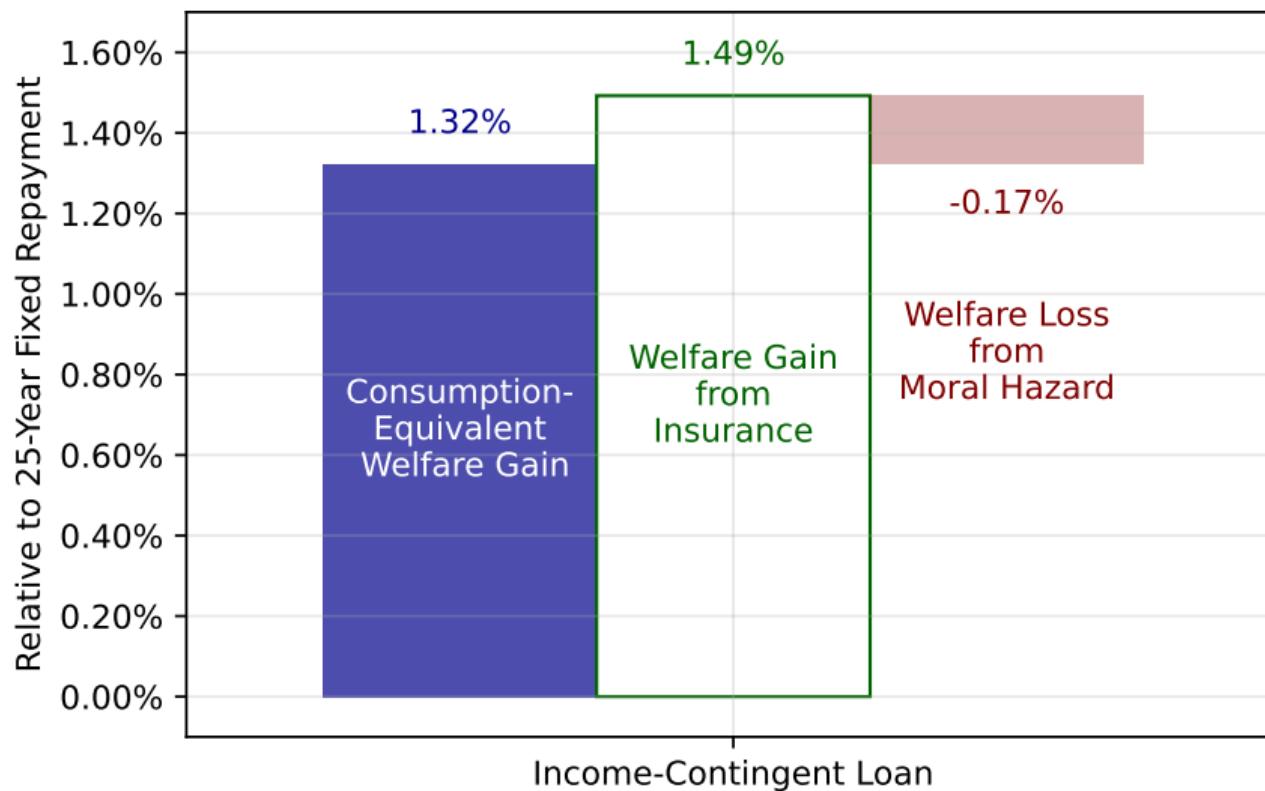

CONSTRAINED-OPTIMUM = 1.3% INCREASE IN LIFETIME CONSUMPTION

CONSTRAINED-OPTIMUM = 1.3% INCREASE IN LIFETIME CONSUMPTION

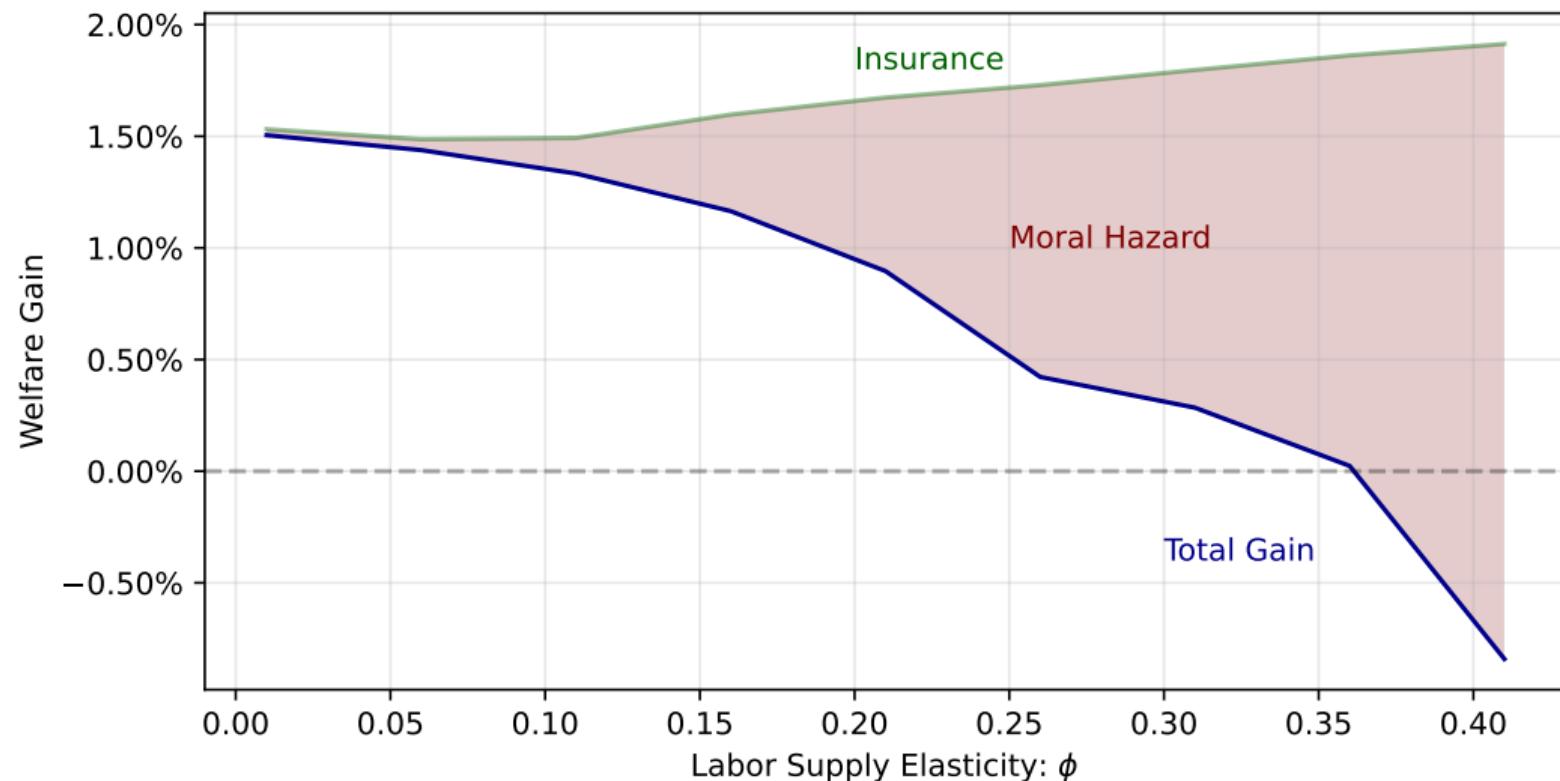

CONSTRAINED-OPTIMUM = 1.3% INCREASE IN LIFETIME CONSUMPTION

► Alt. Models ► Distribution ► Restrict $\psi \leq 10\%$ ► Forgiveness

WELFARE GAIN IS POSITIVE AS LONG AS $\phi < 0.37$

NEXT: OTHER BUDGET-NEUTRAL CONTRACTS...

JUST PROVIDING FORBEARANCE GIVES SMALLER GAINS

- **Benefit** of income-contingent loan: accelerate payments from high-income ► ICL+UI

PURE EQUITY CONTRACT GIVES SMALLER GAINS

- Losses to transferring payments from (low-income) young → (high-income) old

EQUITY + THRESHOLD GIVES LARGER GAINS

- **Benefit of ISA:** uncapped payments from high-income \Rightarrow 70% higher threshold

EQUITY + THRESHOLD GIVES LARGER GAINS, BUT MORE DISPERSED

- **Cost of ISA:** gains more dispersed \Rightarrow likely to cause **ex-ante** responses

Distribution

OUTLINE

- 1 Institutional Background and Data
- 2 Labor Supply Responses to Income-Contingent Repayment
- 3 Life Cycle Model with Endogenous Labor Supply
- 4 Welfare and Fiscal Impacts of Income-Contingent Repayment
- 5 Conclusion

- ① **Empirics:** borrowers adjust labor supply to ↓ income-contingent repayments
 - Larger responses in occupations with more hourly flexibility
 - Responses increase with liquidity constraints and decrease with P (repayment)
- ② **Structural estimation:** labor supply elasticity of **0.11** + adjustment frictions
- ③ **Contract design:** providing insurance with income-contingent loans $\Rightarrow \uparrow$ welfare
 - Moral hazard significantly reduces optimal amount of insurance
 - Fixed repayment \rightarrow optimal income-contingent loan $\Rightarrow \uparrow$ **1.3%** lifetime consumption
 - Forbearance + fixed repayment does worse because of slower repayment

- ① **Empirics:** borrowers adjust labor supply to ↓ income-contingent repayments
 - Larger responses in occupations with more hourly flexibility
 - Responses increase with liquidity constraints and decrease with **P**(repayment)
- ② **Structural estimation:** labor supply elasticity of **0.11** + adjustment frictions
- ③ **Contract design:** providing insurance with income-contingent loans ⇒ ↑ welfare
 - Moral hazard significantly reduces optimal amount of insurance
 - Fixed repayment → optimal income-contingent loan ⇒ ↑ **1.3%** lifetime consumption
 - Forbearance + fixed repayment does worse because of slower repayment

Takeaway: income-contingent repayment creates **moral hazard** that affects contract design, but **too small** to justify fixed repayment

- US “student debt crisis”: 25% of borrowers default within 5 years of graduation
 - Possible solution = change contracts to be **income-contingent** (e.g., SAVE)
- **This paper:** evidence + model to calibrate the effects of different contracts
 - ① Ex-post moral hazard is not a reason to avoid **income-contingent** contracts
 - ② Among these contracts, **income-contingent loans** are relatively effective and robust
- **Open question:** effects on education, occupation, and borrowing choices?
- **Broader question:** is state-contingent repayment useful for other liabilities?
 - HHs: government-provided shared-appreciation mortgages (UK, Canada)
 - Firms: revenue-based financing

VARIABLE DEFINITIONS

- HELP Income = Taxable Income + Fringe Benefits + Foreign Employment Income + Investment or Property Losses + Employer Super Contributions
- Labor Income = Salary/Wages + Allowances & Tips + Self-Employment Income
- Capital Income = Interest and Dividend Income + Annuity Income + Capital Gains + Rental Income + Managed Trust Income
- Net Deductions = Labor Income + Capital Income - HELP Income

◀ Back

AU-US DIFFERENCES MOST LIKELY TO AFFECT CONTRACT DESIGN

- ① More debt in US due to higher tuition, longer degrees, and discretionary items
 - Larger demand for insurance in US, but also more moral hazard
 - Discretionary borrowing in US ⇒ possible ex-ante moral hazard
- ② Active private market in US cream-skims high-income borrowers Bachas 2019
 - Amount of insurance that can be provided might be lower in US
- ③ Student loans more subsidized in Australia than US
 - Possibly different moral hazard in US (if there is selection on MH) Karlan-Zinman 2009
- ④ Tuition and enrollment caps at public universities in Australia
 - Supply-side responses could increase fiscal cost of ICLs in US Kargar-Mann 2023

DIFFERENCES BETWEEN AUSTRALIA AND US: STATISTICS

Feature of Environment	Australia	US
Cost of Higher Education		
Public Undergraduate Tuition Cost	\$2,700–\$10,100 USD per year for CSPs	\$9,500 USD per year for 4-Year In-State \$39,000 USD per year for 4-Year Private Nonprofit
Total Cost of Attendance	\$15,850 USD per year	\$22,700 USD per year
Prevalence of Scholarships	Rare	Common
Initial Student Debt Borrowed	\$8,100–\$30,300 USD	\$51,800 USD (Average)
Student Population		
% of Population with Undergraduate Degree	38%	32%
% of Undergraduates at Private Universities	6%	26%
% of Undergraduates from Abroad	16%	5%
% of Current Students Employed	50%	40%
Income Distribution and Taxes/Transfers		
Median Personal Income	\$33,500 USD	\$40,500 USD
Poverty Line for Single Individual	\$16,200 USD	\$14,580 USD
Gini Coefficient for Income	0.32	0.38
Marginal Tax Rate at Average Income	41%	41%
Heathcote et al. (2017) Tax Progressivity	0.133	0.184
1-Month Individual UI Replacement Rate	23%	35%
Union Membership Rate	13.7%	10.3%

Ease HECS burden on students, say universities

Kate Marshall

Jan 9, 2003 – 11.00am

Save

Share

Australian students owing more than \$9 billion of debts to the federal government should be spared financial heartache under a proposal to lift the income threshold for repayments, the Australian Vice-Chancellors Committee said yesterday.

COMPUTATION OF BUNCHING STATISTIC

- Bunching statistic calculated as in prior literature Chetty et al. 2011, Kleven-Waseem 2013

- Fit 5-piece spline leaving out $[\$32,500, \$35,000 + X]$ \Rightarrow **counterfactual density**
- Iterate and choose X so that counterfactual density integrates to 1
-

$$b = \frac{\text{observed mass in } [\$32,500, \$35,000]}{\text{counterfactual mass in } [\$32,500, \$35,000]} - 1$$

- $b = 0.1 \Rightarrow$ 10% more people below threshold than would be absent discontinuity
 - Note: normalization makes b comparable across distributions of different shapes
- Sample:** All debtholders age 20 to 64 pooled across 2005 to 2018
 - Income deflated to 2005 so 0% threshold constant in real terms at **\$35,000**

ADDITIONAL EMPIRICAL RESULTS

- ① **Persistence** of bunching below threshold lasts around three years 
- ② No discontinuity in probability of **switching occupations** around threshold 
- ③ Limited heterogeneity in bunching with household **demographics** 
 - Caveat: no extensive margin responses, which can vary across groups Saez et al. 2012
- ④ Limited evidence of bunching coming from **firm responses** (as in Chetty et al. 2011) 
- ⑤ Additional tests for **evasion**:
 - Bunching present in **salary and wages**, which is harder to misreport Slemrod 2019 
 - Minimal difference in bunching based on **filing type** 
 - Bunching declines by only 4% when dropping **self-employed** 
 - Borrowers are median income ⇒ less avoidance opportunities Slemrod-Yitzhaki 2002

COMPARISON WITH EXISTING LITERATURE ON LABOR SUPPLY (1/2)

Source: intensive-margin Hicks and Frisch elasticities in Keane (2011) and Chetty (2012)

Reasons why frictionless elasticity may be smaller/frictions larger:

- ① Different **sample** of college graduates: less flexibility and further from $y_t = w_t l_t$
- ② Elasticity is **local** to threshold: no high-income individuals Gruber-Saez 2002
- ③ Bunching does not identify **extensive** margin responses Saez et al. 2012

Contributions:

- ① **Empirical** characterization of responses to income-contingent repayment
 - ℓ_t of indebted households responds to liquidity not wealth, like c_t Ganong-Noel 2020
- ② **Dynamic** model of labor supply with time- and state-dependent adjustment

FULL ESTIMATION RESULTS

Parameter		Estimation						
		(1)	(2)	(3)	(4)	(5)	(6)	(7)

MODEL FIT: OTHER TARGET MOMENTS

Estimation Target	Data	Model
Average Labor Income	\$42,639	\$45,582
Cross-Sectional Variance of Log Labor Income at Age 22	0.453	0.462
Cross-Sectional Variance of Log Labor Income at Age 32	0.555	0.491
Cross-Sectional Variance of Log Labor Income at Age 42	0.577	0.525
Cross-Sectional Variance of Log Labor Income at Age 52	0.539	0.580
Cross-Sectional Variance of Log Labor Income at Age 62	0.608	0.657
Linear Age Profile Term	0.077	0.080
Quadratic Age Profile Term	-0.001	-0.001
Education Income Premium Constant	-0.574	-0.554
Education Income Premium Slope	0.023	0.023
10th Percentile of 1-Year Labor Income Growth	-0.387	-0.392
10th Percentile of 5-Year Labor Income Growth	-0.667	-0.705
90th Percentile of 1-Year Labor Income Growth	0.415	0.393
90th Percentile of 5-Year Labor Income Growth	0.698	0.710
Average Labor Supply	1.000	0.963
Average Capital Income between Ages 40 and 44	\$1,338	\$1,332

◀ Back

ADDITIONAL MODEL RESULTS: POSITIVE

- ① **Robustness:** $\hat{\phi} = 0.111$ with linear adjustment costs (vs. 0.114) 
- ② **Validation** of baseline model on nontargeted moments: 
 - Matches heterogeneity in bunching by debt and age (LBD model cannot)
 - Replicates bunching at changes in marginal income tax rates
- ③ **P(Repayment) matters:**
 - Counterfactual with indefinite repayment \Rightarrow bunching $\uparrow 70\%$ 
 - Ignoring dynamic incentives $\Rightarrow \hat{\phi} \downarrow 40\%$ 
- ④ **Liquidity matters:** risk-free borrowing up to natural limit \Rightarrow bunching $\downarrow 90\%$ 

 Back

VALIDATION OF BASELINE MODEL ON NONTARGETED BUNCHING

Heterogeneity by Debt and Age

Bunching at Changes in Tax Rates

◀ Back

DYNAMICS: BUNCHING DEPENDS ON PROBABILITY OF REPAYMENT

- **Data:** bunching increases with debt and decreases with lifetime income
- **Model:** no repayment limit $\Rightarrow \uparrow$ PDV of repayment reduction \Rightarrow bunching $\uparrow 70\%$

◀ Back

LIQUIDITY: BORROWING CONSTRAINTS AMPLIFY RESPONSES

- **Data:** bunching \downarrow in wealth and \uparrow in liquidity demands
- **Model:** freely borrow at $r_f \Rightarrow \downarrow$ value of repayment reduction \Rightarrow bunching \downarrow **90%**
